

Capítol 2. Transmissió de dades

2.1 Medis i sistemes de transmissió

2.2 Adaptadors al canal

2.3 Sources of packet delay

Book: Data and Computer Communications, Tenth Edition by William Stallings,
(c) Pearson Education - Prentice Hall, 2014

2.1 Medis de transmissió

2.1.1 Anàlisi freqüencial

2.1.2 Medis

2.1.1 Anàlisi freqüencial

Velocitats en transmissió de dades

- Transmissió

$$V_t = \text{bits/seg}$$

$$V_m = \text{símbols/seg (Bauds)}$$

$$V_m = V_t \text{ si símbol} = 1 \text{ bit}$$

- Propagació

$$V_p = \text{Km/seg}$$

- Llargària d'un bit = V_p / V_t

Frequency, Spectrum and Bandwidth

Time Domain Concepts

- **analog signal**
 - *signal intensity varies smoothly with no breaks*
- **digital signal**
 - *signal intensity maintains a constant level and then abruptly changes to another level*
- **periodic signal**
 - *signal pattern repeats over time*
- **aperiodic signal**
 - *pattern not repeated over time*

Analog and Digital Signals

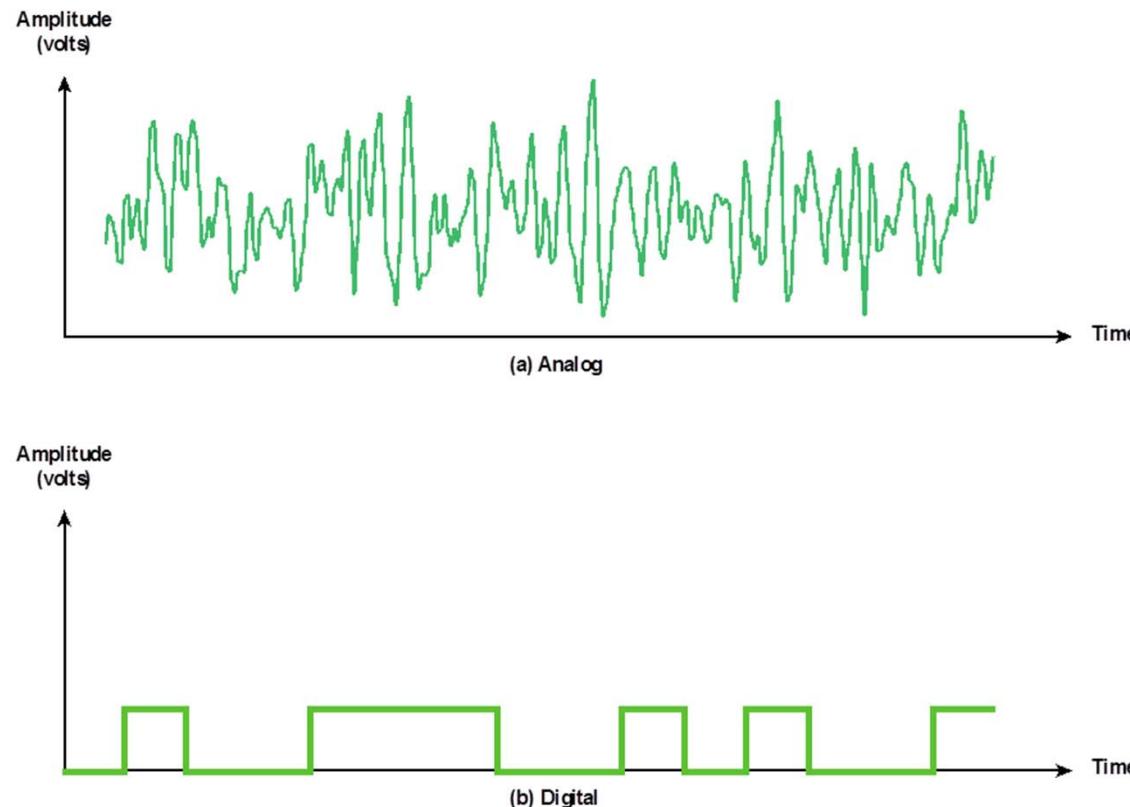

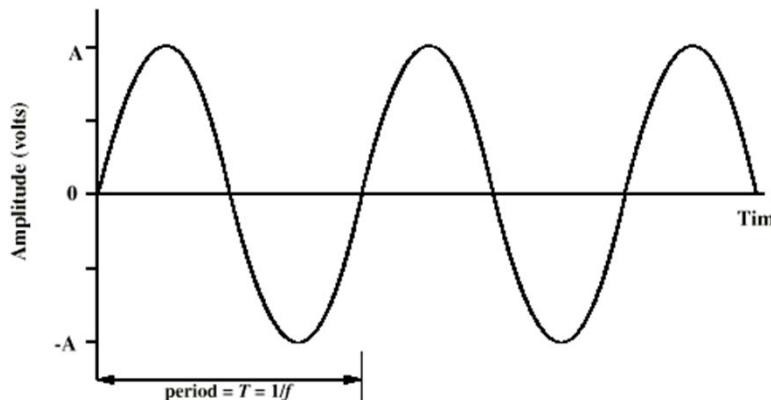

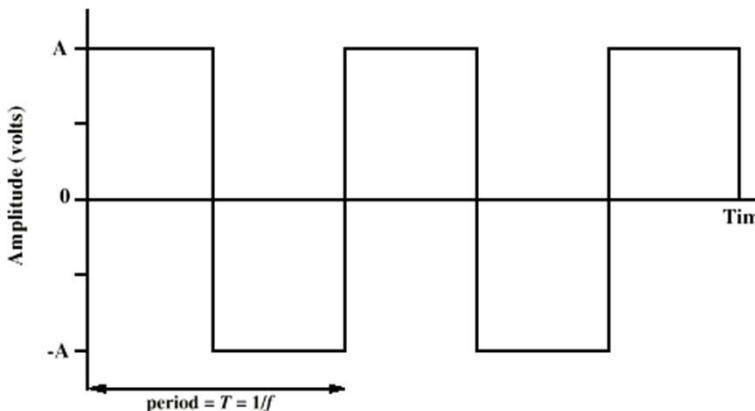

Figure 3.1 Analog and Digital Waveforms

Periodic Signals

(a) Sine wave

(b) Square wave

Sine Wave

(periodic continuous signal)

- **peak amplitude (A)**
 - maximum strength of signal
 - typically measured in volts
- **frequency (f)**
 - rate at which the signal repeats
 - Hertz (Hz) or cycles per second
 - period (T) is the amount of time for one repetition
 - $T = 1/f$
- **phase (ϕ)**
 - relative position in time within a single period of signal

Varying Sine Waves

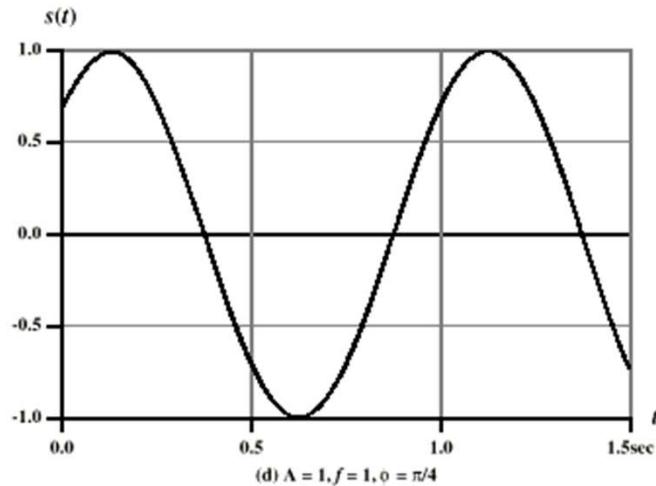

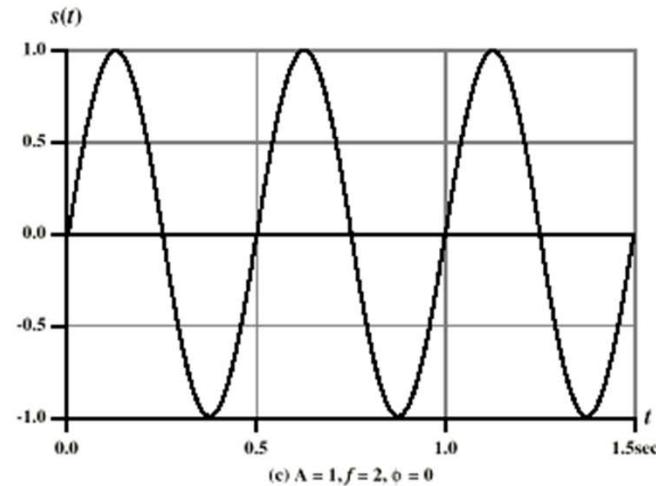

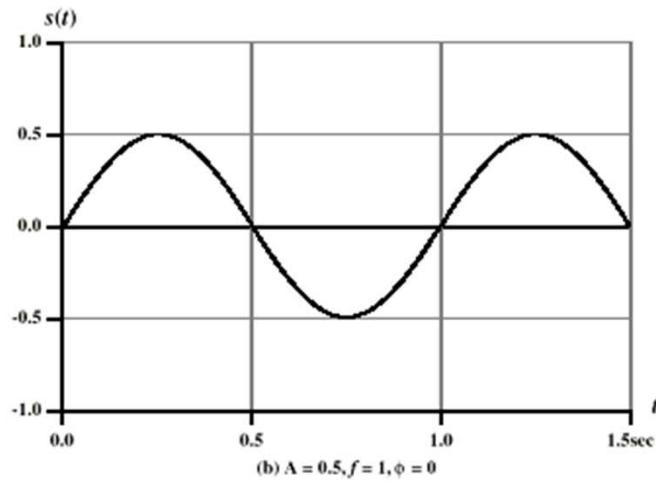

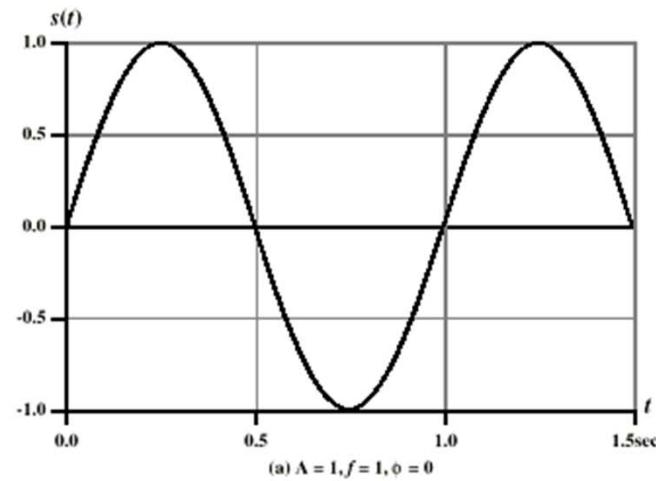

$$s(t) = A \sin(2\pi ft + \phi)$$

Figure 3.3

Frequency Domain Concepts

- signals are made up of many frequencies
- components are sine waves
- Fourier analysis can show that any signal is made up of components at various frequencies, in which each component is a sinusoid
- can plot frequency domain functions

Addition of Frequency Components ($T=1/f$)

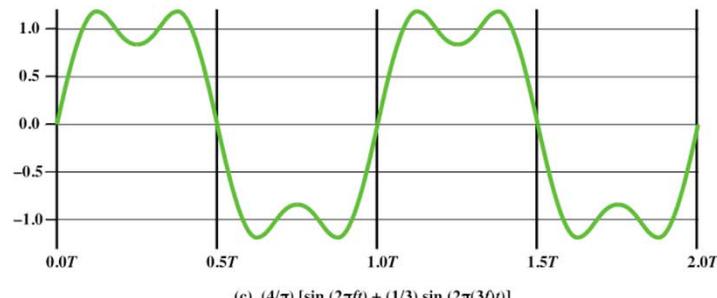

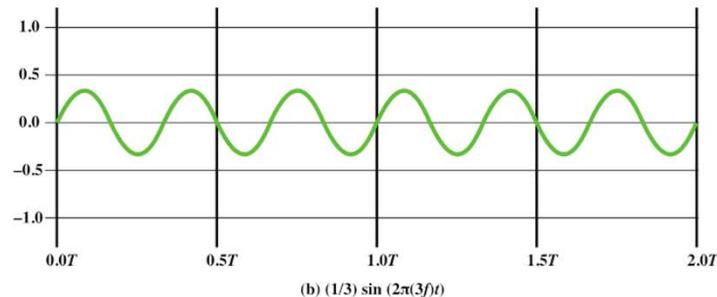

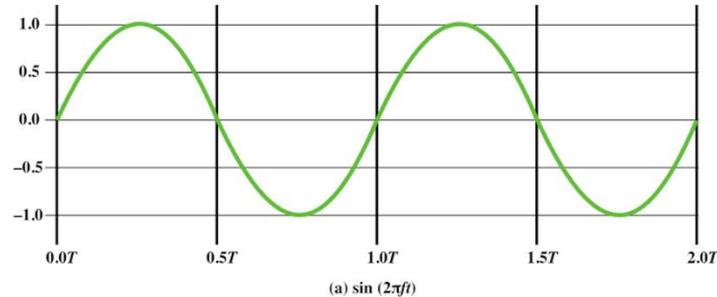

Figure 3.4 Addition of Frequency Components ($T = 1/f$)

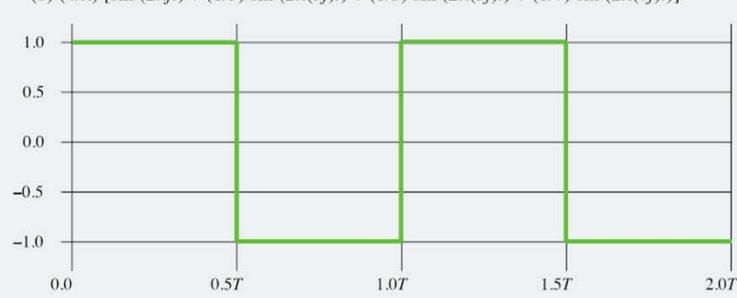

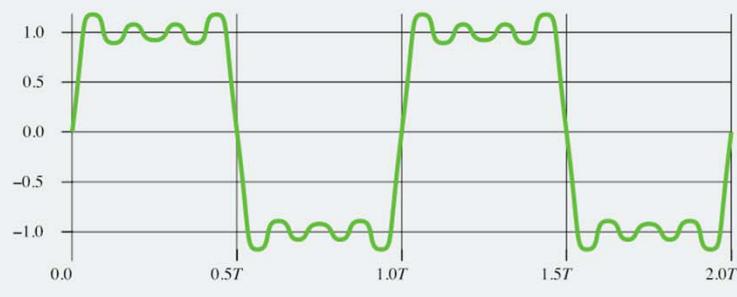

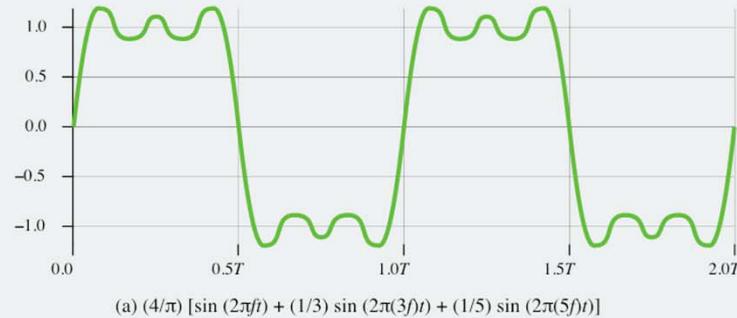

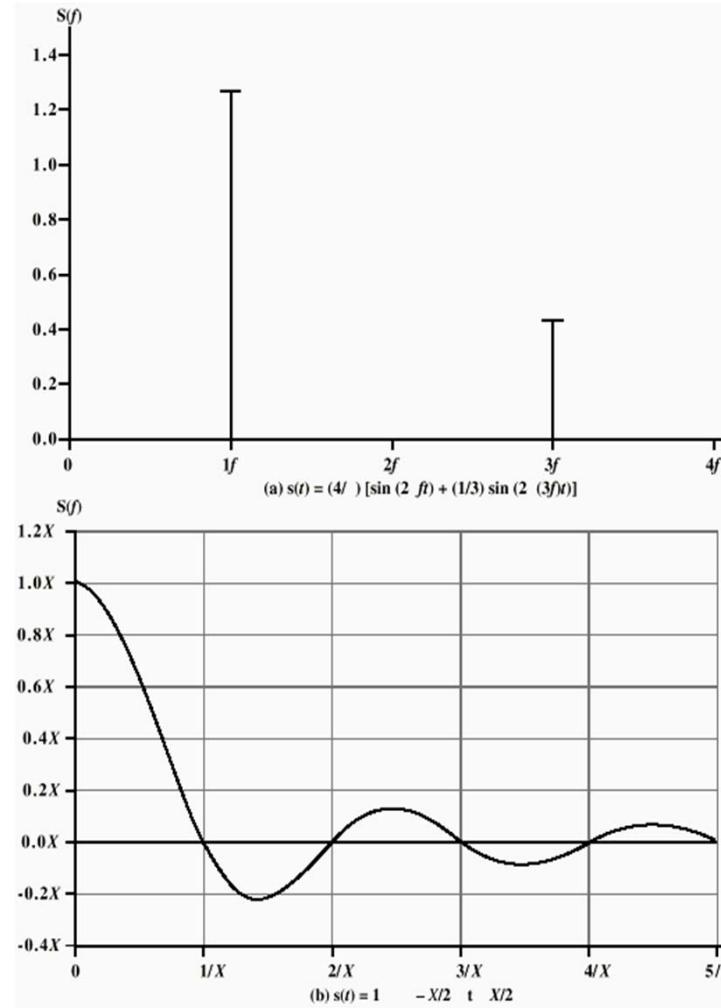

Figure 3.7 Frequency Components of Square Wave ($T = 1/f$)

Frequency Domain Representations

- frequency domain function
- frequency domain function of single square pulse

Spectrum & Bandwidth

spectrum

- range of frequencies contained in signal

absolute bandwidth

- width of spectrum

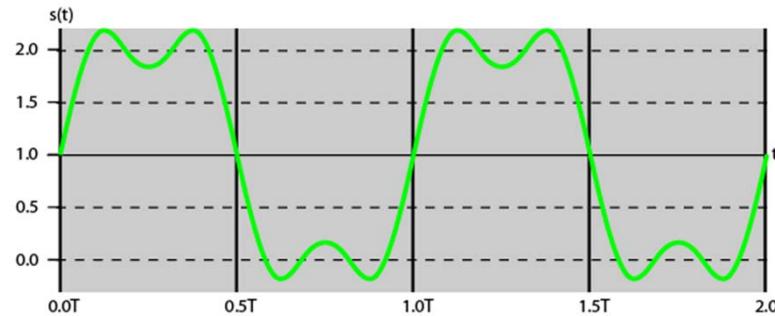

effective bandwidth

- often just bandwidth
- narrow band of frequencies containing most energy

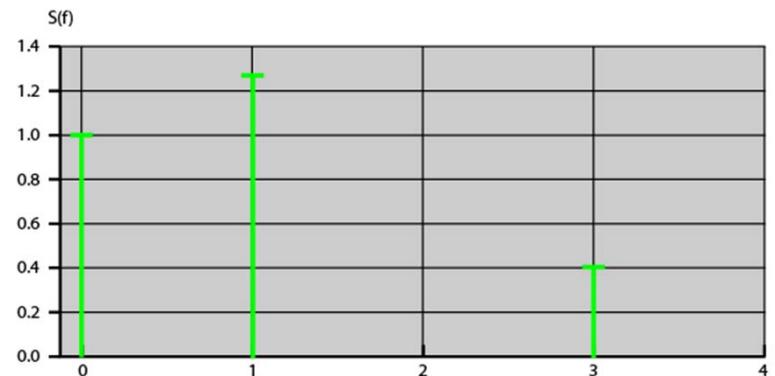

dc component

- component of zero frequency

Signal with dc Component

$$(a) s(t) = 1 + \frac{4}{\pi} [\sin(2\pi ft) + \frac{1}{3} \sin(6\pi ft)]$$

$$(b) S(f)$$

Data Rate and Bandwidth

any transmission system has a limited band of frequencies

this limits the data rate that can be carried on the transmission medium

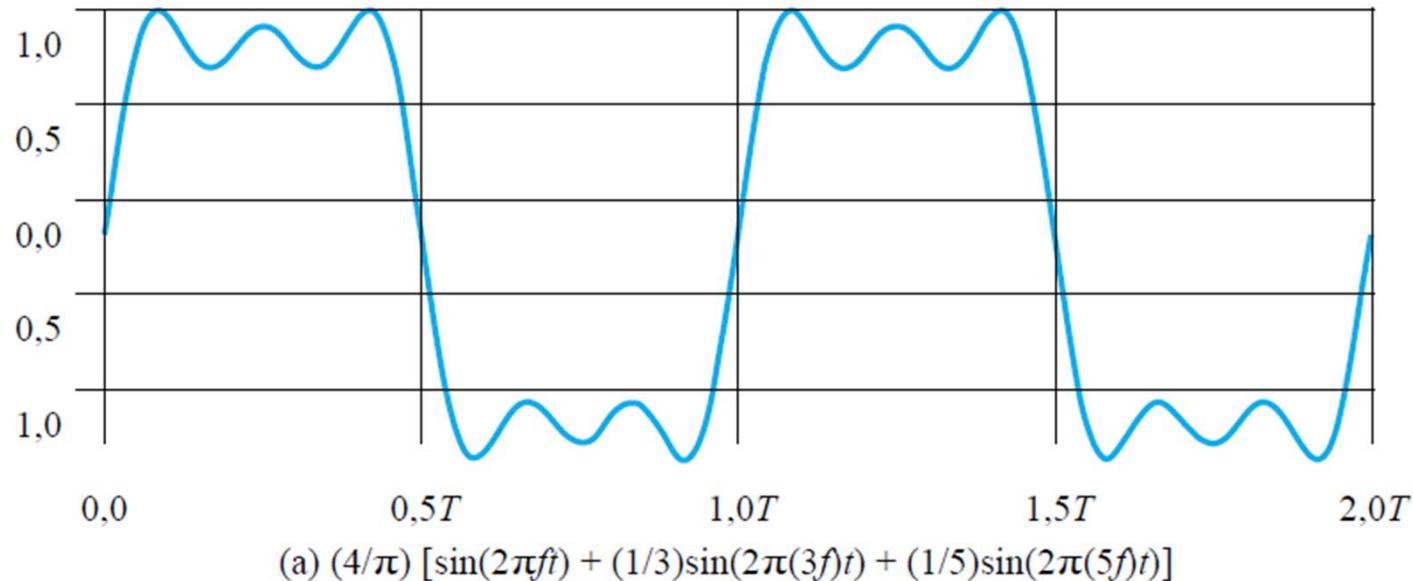

limiting bandwidth creates distortions

most energy in first few components

square waves have infinite components and hence an infinite bandwidth

There is a direct relationship between data rate and bandwidth.

Data Rate and Bw

Si $f = 1 \text{ Mhz}$; $Bw = 4 \text{ Mhz}$ ($5f-1f$)

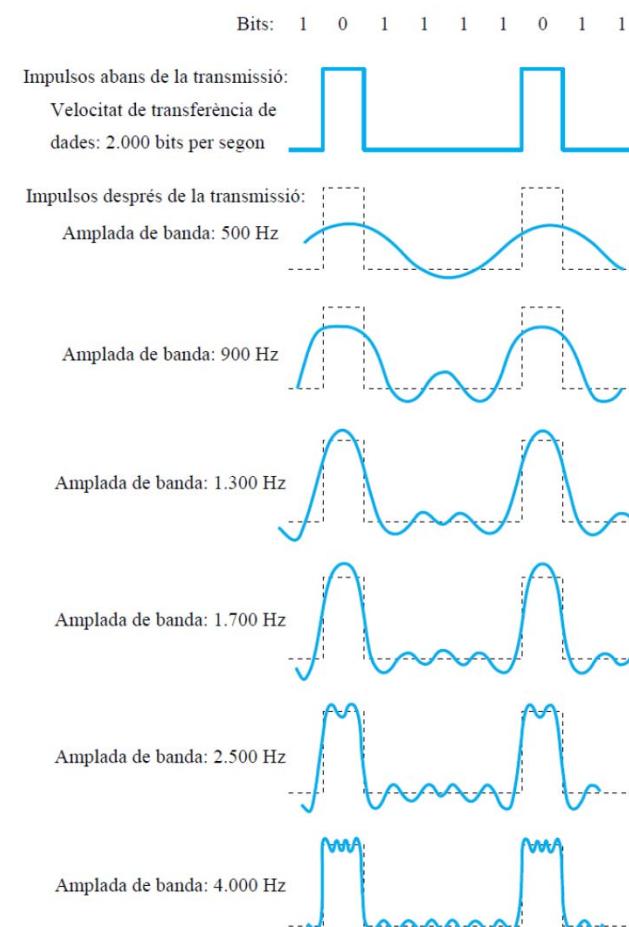

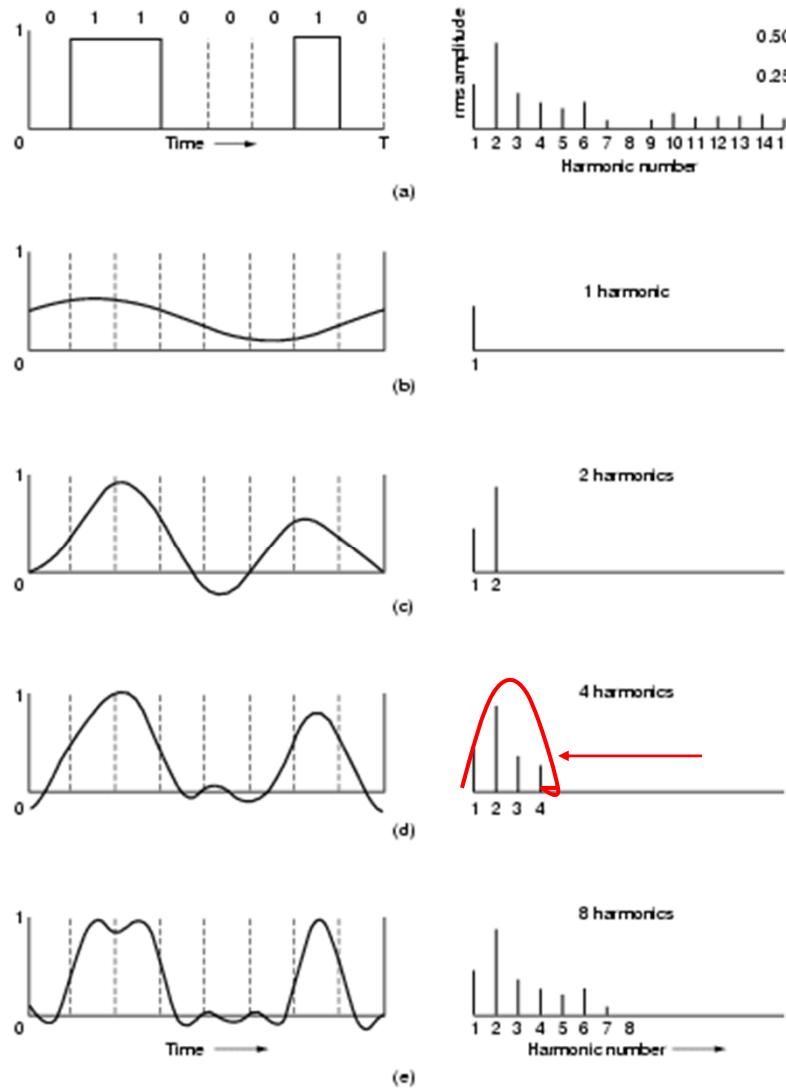

$T = 1/f = 1 \text{ microseg}$; temps bit = 0,5 microseg

2 bits/hertz ; $Vt = 2 \times 1 \text{ Mhz} = 2 \text{ Mbps}$

Si $f = 2 \text{ Mhz}$; $Bw = 8 \text{ Mhz}$; $T = 0,5 \text{ microseg}$

2 bits/hertz $Vt = 4 \text{ Mbps}$

Example spectral analysis

Design Factors Determining Data Rate and Distance

bandwidth

- higher bandwidth gives higher data rate

transmission impairments

- impairments, such as attenuation, limit the distance

interference

- overlapping frequency bands can distort or wipe out a signal

number of receivers

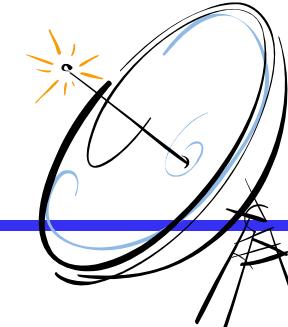

- more receivers introduces more attenuation

2.1.2 *Medis de transmissió*

- 1. Wireless**
- 2. Parell trenat**
- 3. Cable coaxial**
- 4. Fibra òptica**
- 5. Signal/Noise Rate**

1. Wireless

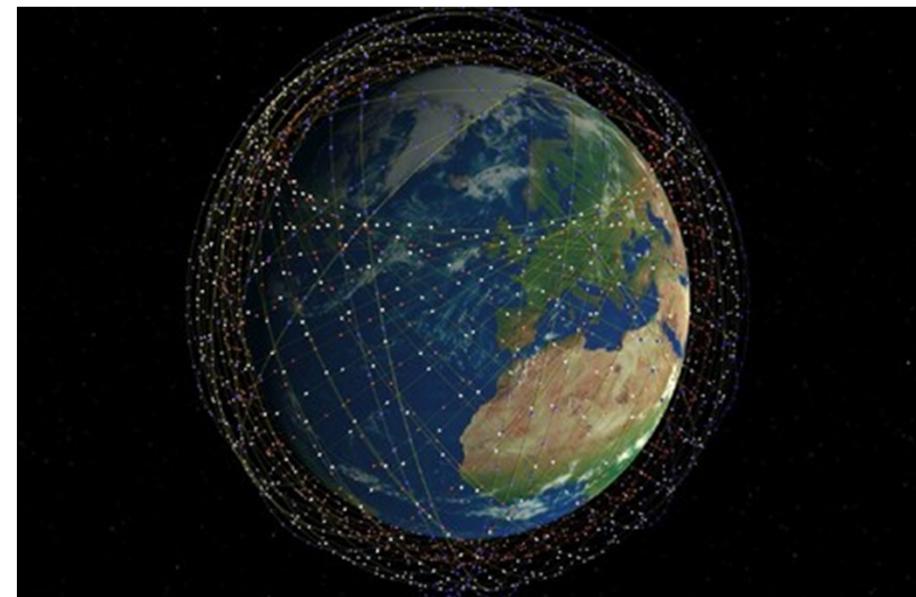

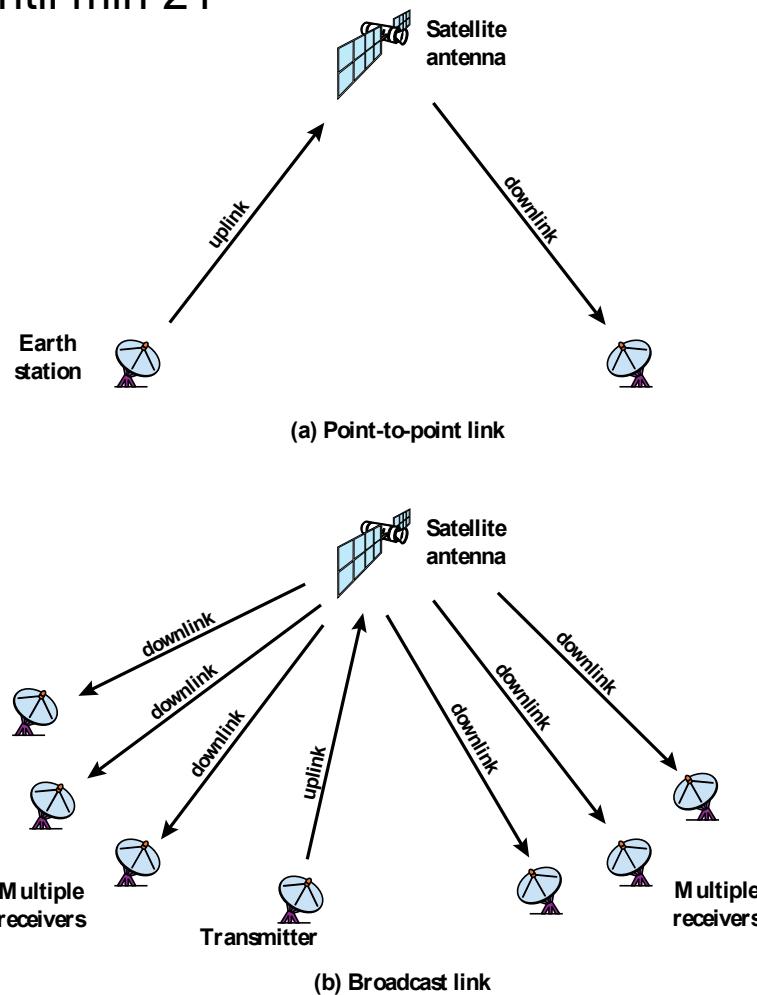

- Electrical conductor or system of conductors used to radiate or collect electromagnetic energy
- Radio frequency electrical energy from the transmitter is converted into electromagnetic energy by the antenna and radiated into the surrounding environment
- Reception occurs when the electromagnetic signal intersects the antenna
- In two way communication, the same antenna can be used for both transmission and reception

Configurations for satellite communication

https://www.youtube.com/watch?v=qs2QcycggWU&ab_channel=BranchEducation

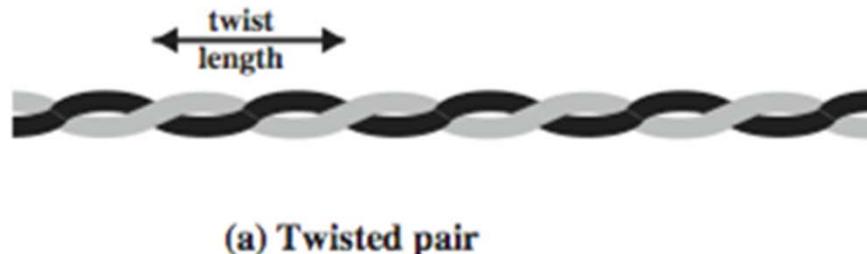

Until min 21

Starlink (SpaceX)

2. Twisted Pair (*Parell trenat*)

- Separately insulated
- Twisted together
- Often "bundled" into cables
- Usually installed in building during construction

Twisted pair is the least expensive and most widely used guided transmission medium.

- **consists of two insulated copper wires arranged in a regular spiral pattern**
- **a wire pair acts as a single communication link**
- **pairs are bundled together into a cable**
- **most commonly used in the telephone network and for communications within buildings**

Unshielded vs. Shielded Twisted Pair

Unshielded Twisted Pair (UTP)

- ordinary telephone wire
- cheapest
- easiest to install
- suffers from external electromagnetic interference

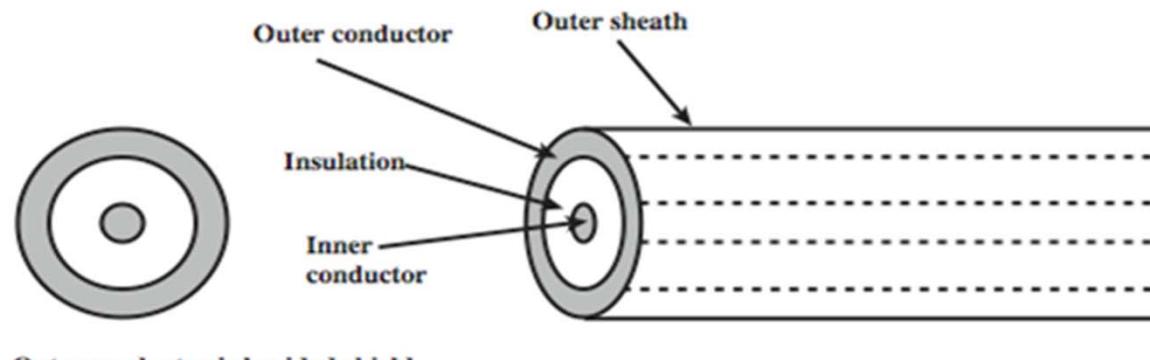

Shielded Twisted Pair (STP)

- has metal braid or sheathing that reduces interference
- provides better performance at higher data rates
- more expensive
- harder to handle (thick, heavy)

UTP Categories

	Category 3 Class C	Category 5 Class D	Category 5E	Category 6 Class E	Category 7 Class F
Bandwidth	16 MHz	100 MHz	100 MHz	200 MHz	600 MHz
Cable Type	UTP	UTP/FTP	UTP/FTP	UTP/FTP	SSTP
Link Cost (Cat 5 = 1)	0.7	1	1.2	1.5	2.2

3. Coaxial Cable

- Outer conductor is braided shield
- Inner conductor is solid metal
- Separated by insulating material
- Covered by padding

(b) Coaxial cable

Coaxial cable can be used over longer distances and support more stations on a shared line than twisted pair.

- consists of a hollow outer cylindrical conductor that surrounds a single inner wire conductor
- is a versatile transmission medium used in a wide variety of applications
- used for TV distribution, long distance telephone transmission and LANs

4. Optical Fiber

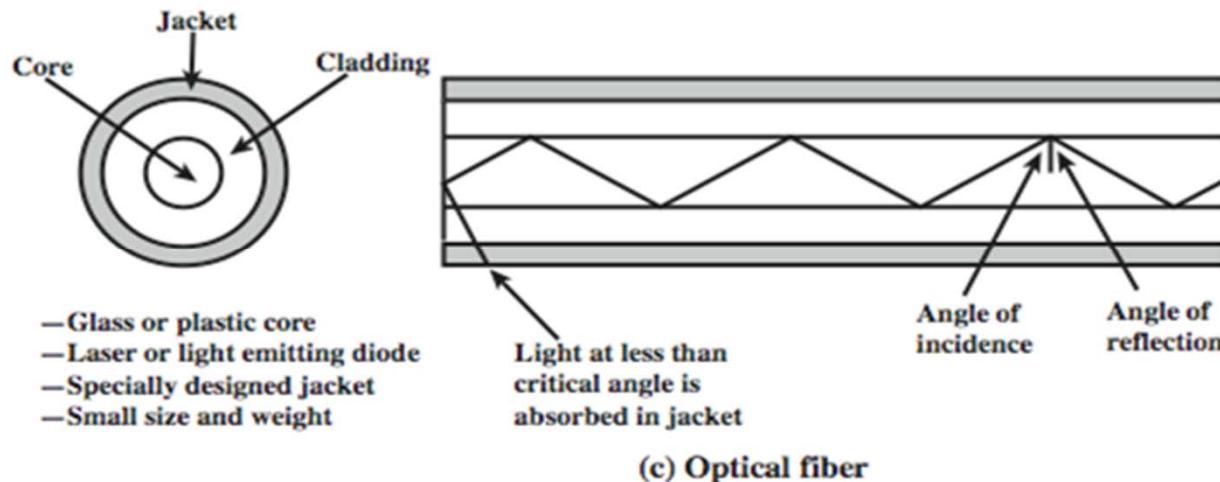

Figure 4.2

Optical fiber is a thin flexible medium capable of guiding an optical ray.

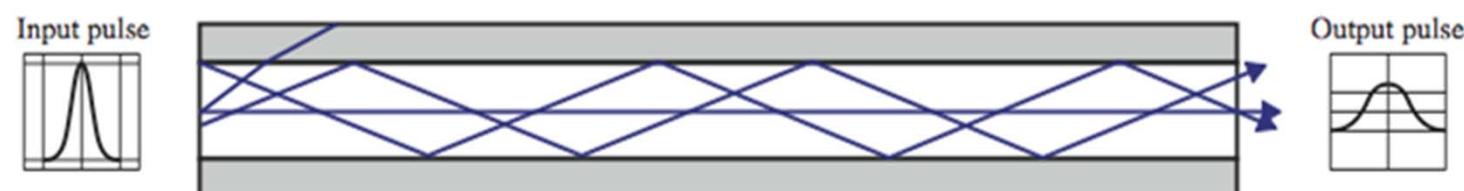

- various glasses and plastics can be used to make optical fibers
- has a cylindrical shape with three sections – core, cladding, jacket
- widely used in long distance telecommunications
- performance, price and advantages have made it popular to use

Optical Fiber - Benefits

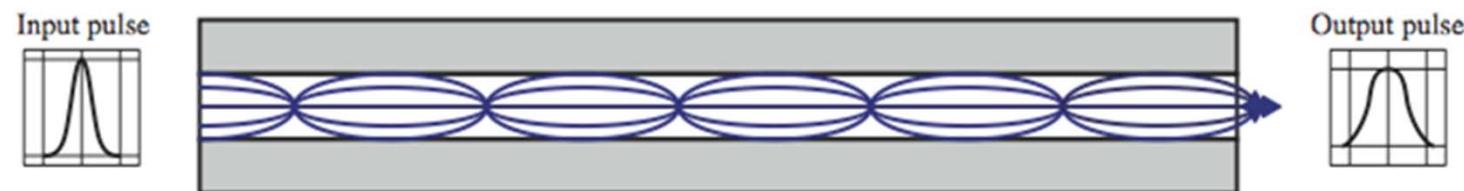

- greater capacity
 - data rates of hundreds of Gbps
- smaller size and lighter weight
 - considerably thinner than coaxial or twisted pair cable
 - reduces structural support requirements
- lower attenuation
- electromagnetic isolation
 - not vulnerable to interference, impulse noise, or crosstalk
 - high degree of security from eavesdropping
- greater repeater spacing
 - lower cost and fewer sources of error

Optical Fiber Transmission Modes

(a) Step-index multimode

(b) Graded-index multimode

(c) Single mode

Figure 4.6

Frequency Utilization for Fiber Applications

Wavelength (in vacuum) range (nm)	Frequency Range (THz)	Band Label	Fiber Type	Application
820 to 900	366 to 333		Multimode	LAN
1280 to 1350	234 to 222	S	Single mode	Various
1528 to 1561	196 to 192	C	Single mode	WDM
1561 to 1620	192 to 185	L	Single mode	WDM

Table 4.3

Attenuation

Equalize attenuation across the band of frequencies used by using loading coils or amplifiers.

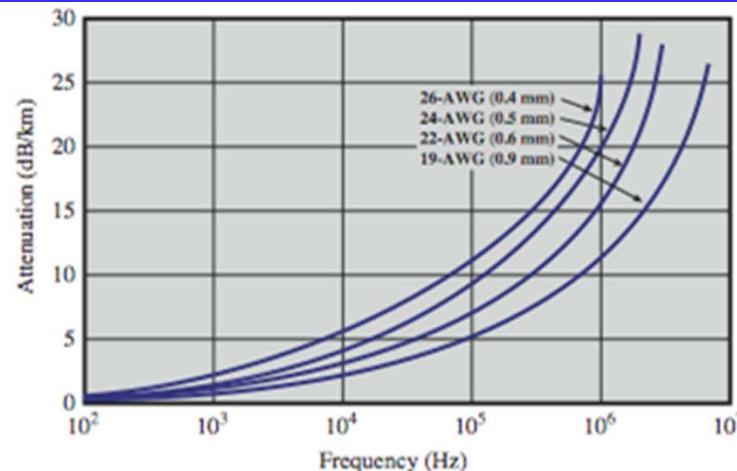

Received signal strength must be:

- strong enough to be detected
- sufficiently higher than noise to be received without error

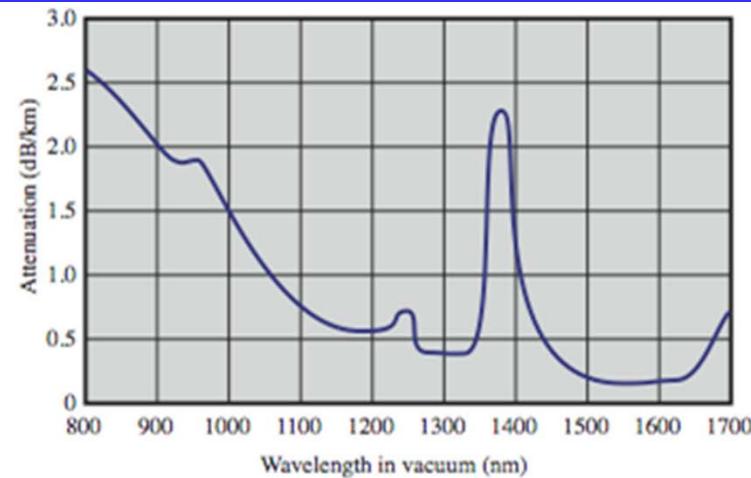

Strength can be increased using amplifiers or repeaters.

- **signal strength falls off with distance over any transmission medium**
- **varies with frequency**

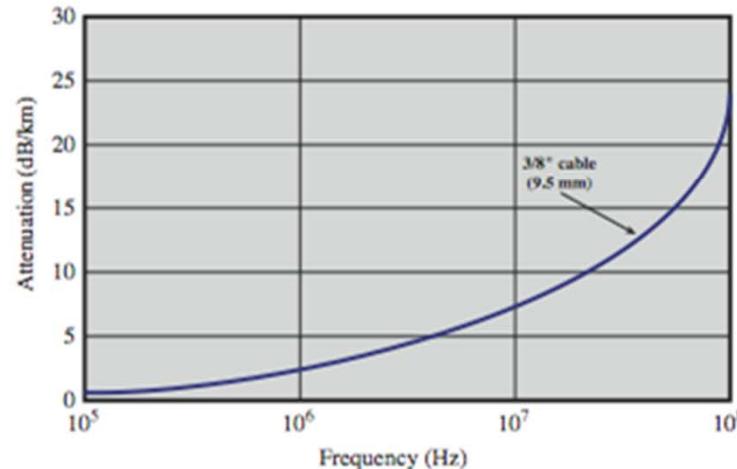

Attenuation in Guided Media

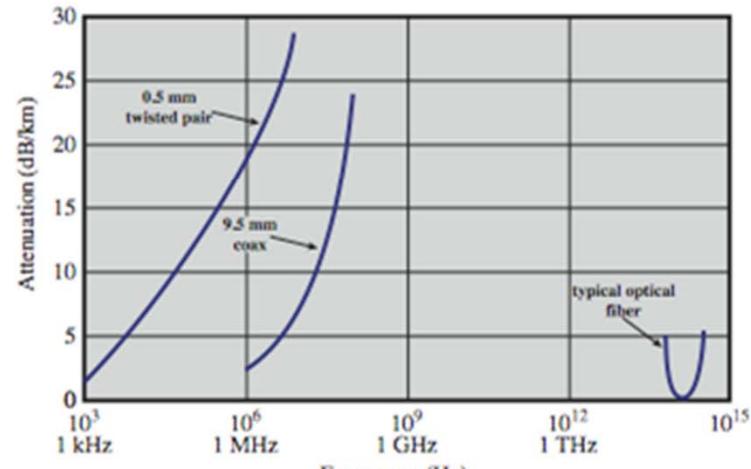

(a) Twisted pair (based on [REEV95])

(c) Optical fiber (based on [FREE02])

(b) Coaxial cable (based on [BELL90])

(d) Composite graph

Figure 4.3

Attenuation Distortion

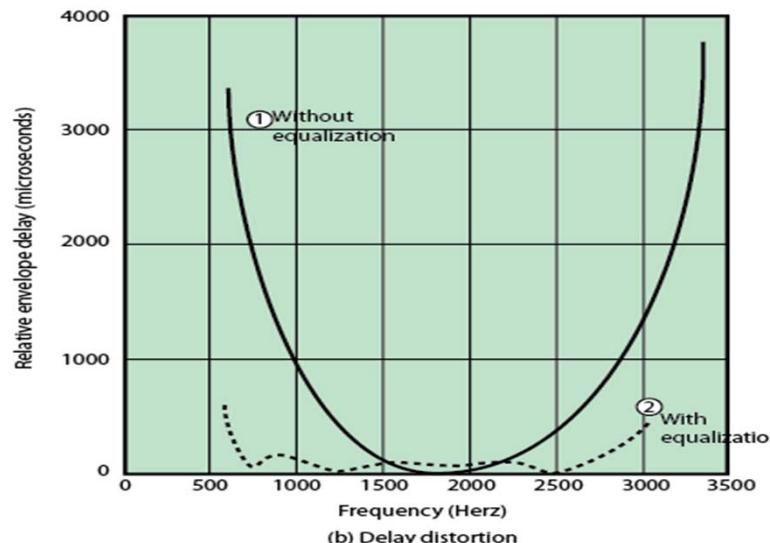

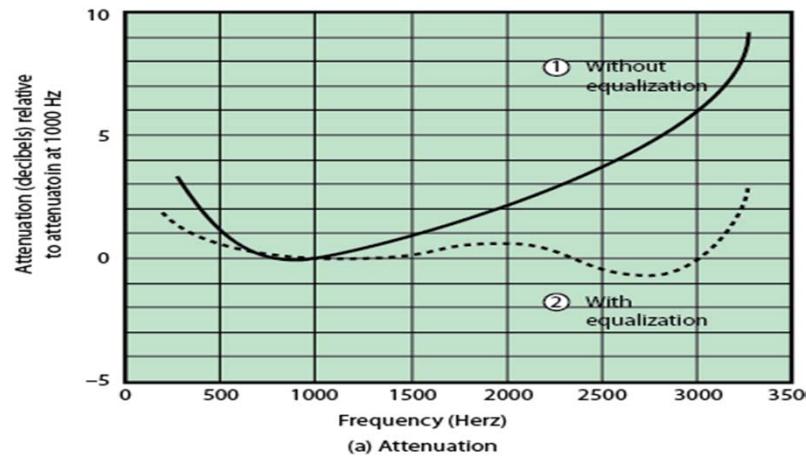

Figure 3.14

Delay Distortion

- occurs because propagation velocity of a signal through a guided medium varies with frequency
- various frequency components arrive at different times resulting in phase shifts between the frequencies
- particularly critical for digital data since parts of one bit spill over into others causing intersymbol interference

5. Signal/Noise rate. Categories of Noise

Impulse Noise:

- caused by external electromagnetic interferences
- noncontinuous, consisting of irregular pulses or spikes
- short duration and high amplitude
- minor annoyance for analog signals but a major source of error in digital data

Crosstalk:

- a signal from one line is picked up by another
- can occur by electrical coupling between nearby twisted pairs or when microwave antennas pick up unwanted signals

Signal/Noise S/N es medida en dB. dB= 10 log S/N

Nyquist Bandwidth

- Difference between symbol/s and b/s

In the case of a channel that is noise free:

- if rate of signal transmission is $2B$ then can carry signal with frequencies no greater than B
 - given bandwidth B , highest signal rate is $2B$
- for binary signals, $2B$ bps needs bandwidth B Hz
- can increase rate by using M signal levels
- Nyquist Formula: $C \text{ (b/s)} = 2B \text{ (symbol/s)} \log_2 M$
- data rate can be increased by increasing signals
 - however this increases burden on receiver
 - noise & other impairments limit the value of M

Shannon Capacity Formula

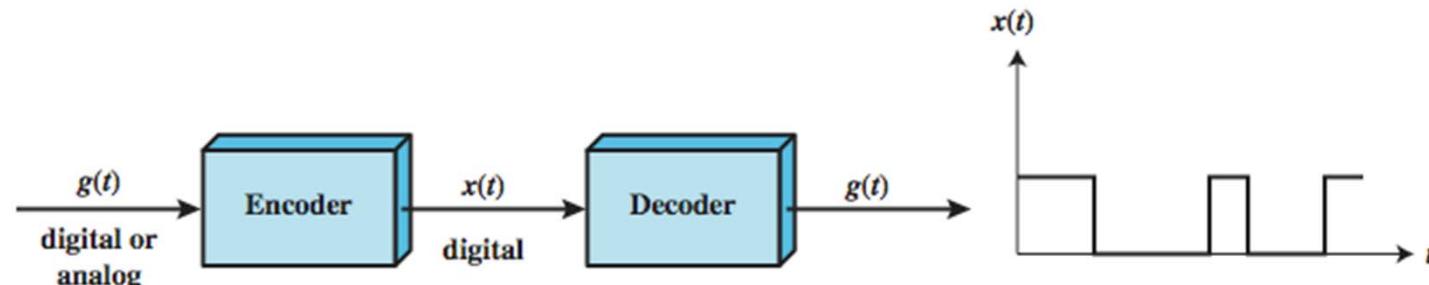

- considering the relation of data rate, noise and error rate:
 - faster data rate shortens each bit so bursts of noise corrupts more bits
 - given noise level, higher rates mean higher errors
- Shannon developed formula relating these to signal to noise ratio (in decibels)
- $\text{SNR}_{\text{db}} = 10 \log_{10} (\text{signal/noise})$
- capacity $C = B \log_2(1+\text{SNR})$
 - theoretical maximum capacity
 - get much lower rates in practice

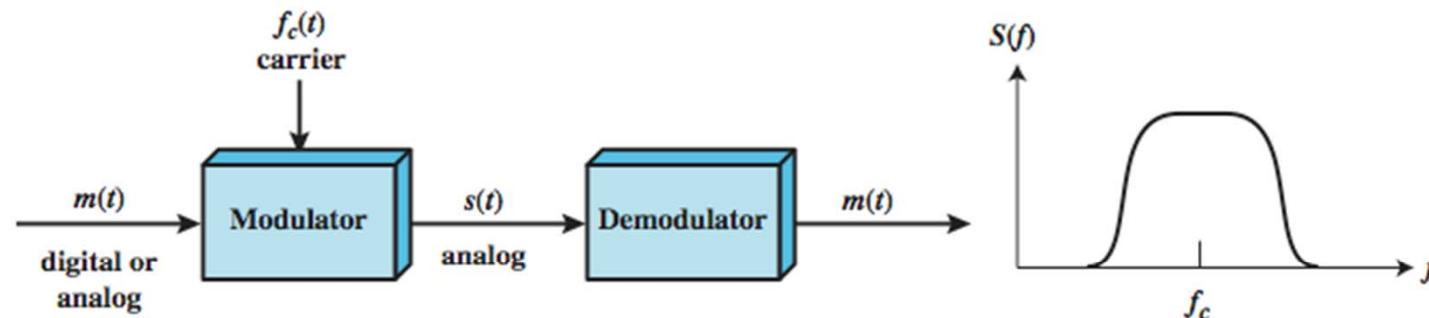

2.2 Adaptadors al canal

1. *Codificació*
2. *Modulació*
3. *Multiplexació*
4. *Commutació*

Signal Adaptation Techniques

(a) Encoding onto a digital signal

(b) Modulation onto an analog signal

Figure 5.1 Encoding and Modulation Techniques

1. *Encoding*

- signal spectrum
- clocking
- error detection
- signal interference and noise immunity
- cost and complexity

Encoding Schemes

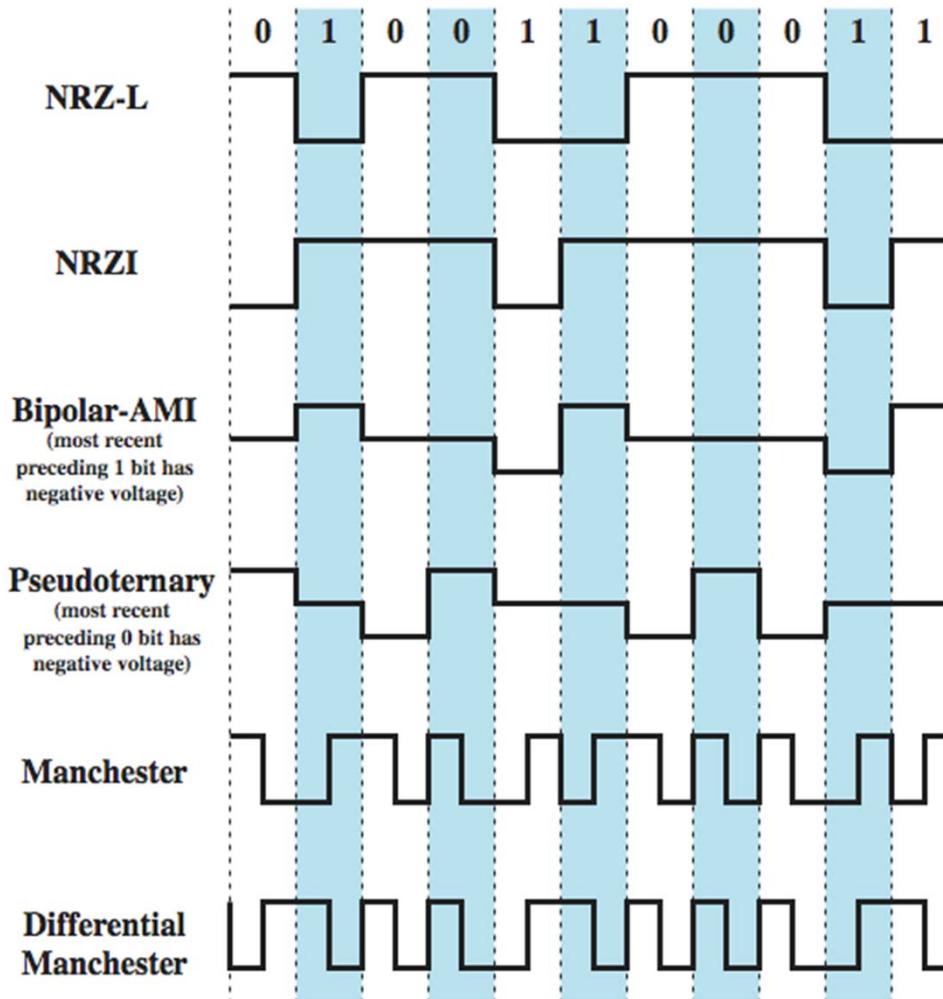

Figure 5.2

Modulation Rate

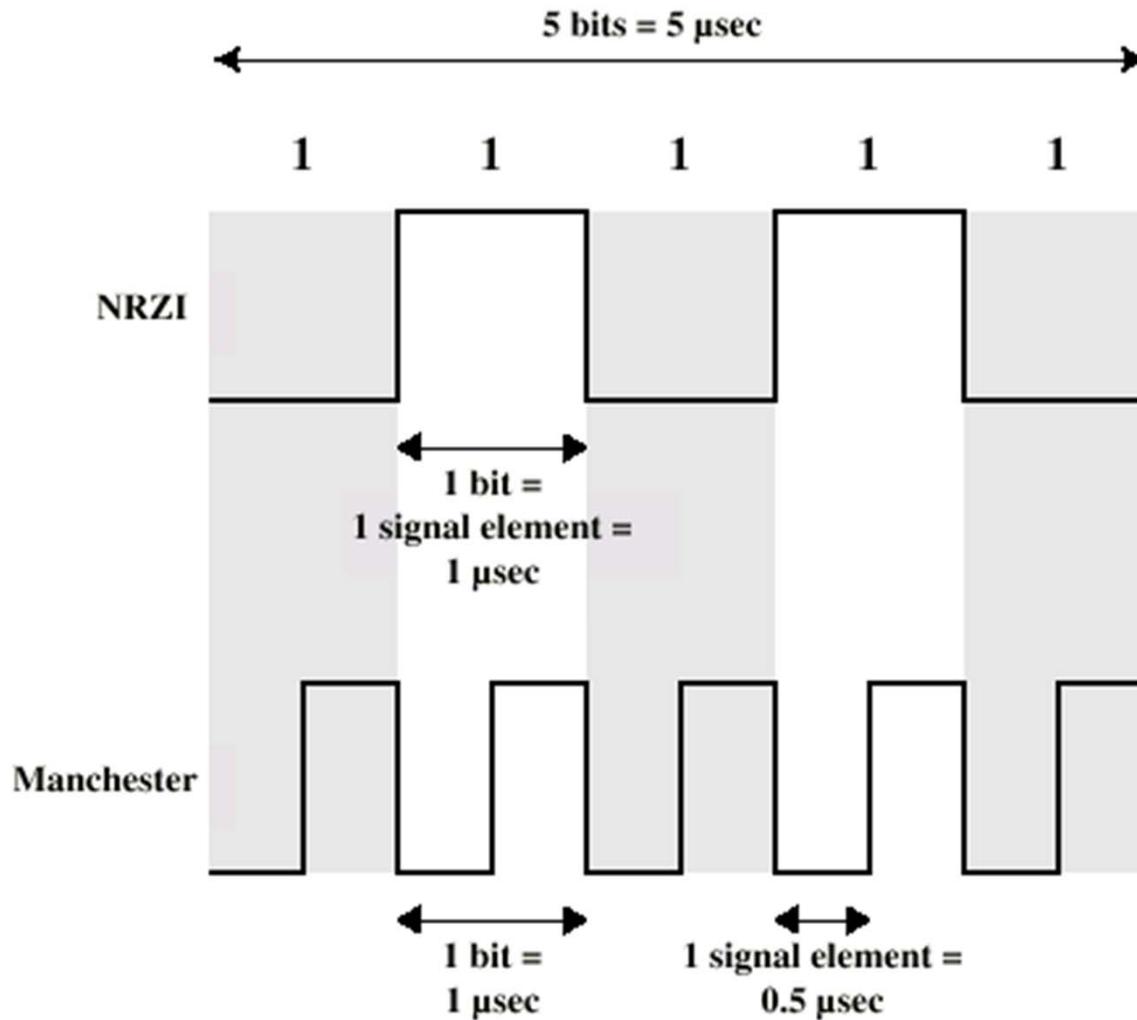

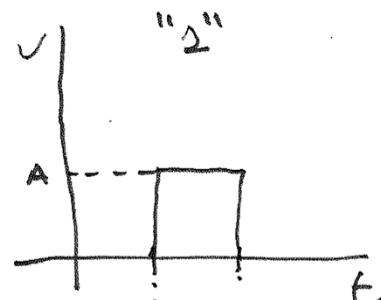

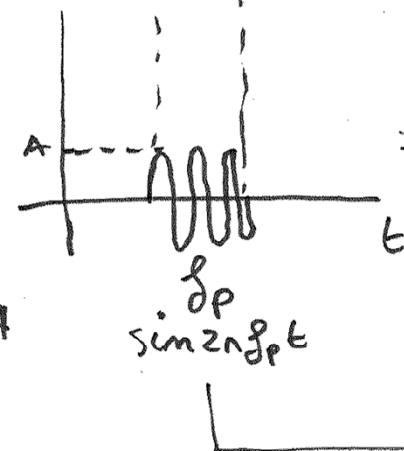

Figure 5.5

2. Modulació

senyal multilivell
CODIFICACIÓ

Aquí puc variar
A, f, φ per Nyquist

MODULACIÓ

Puc posar l'espectre
del senyal en valors en l'eix f
variant f_p

Modulation Techniques

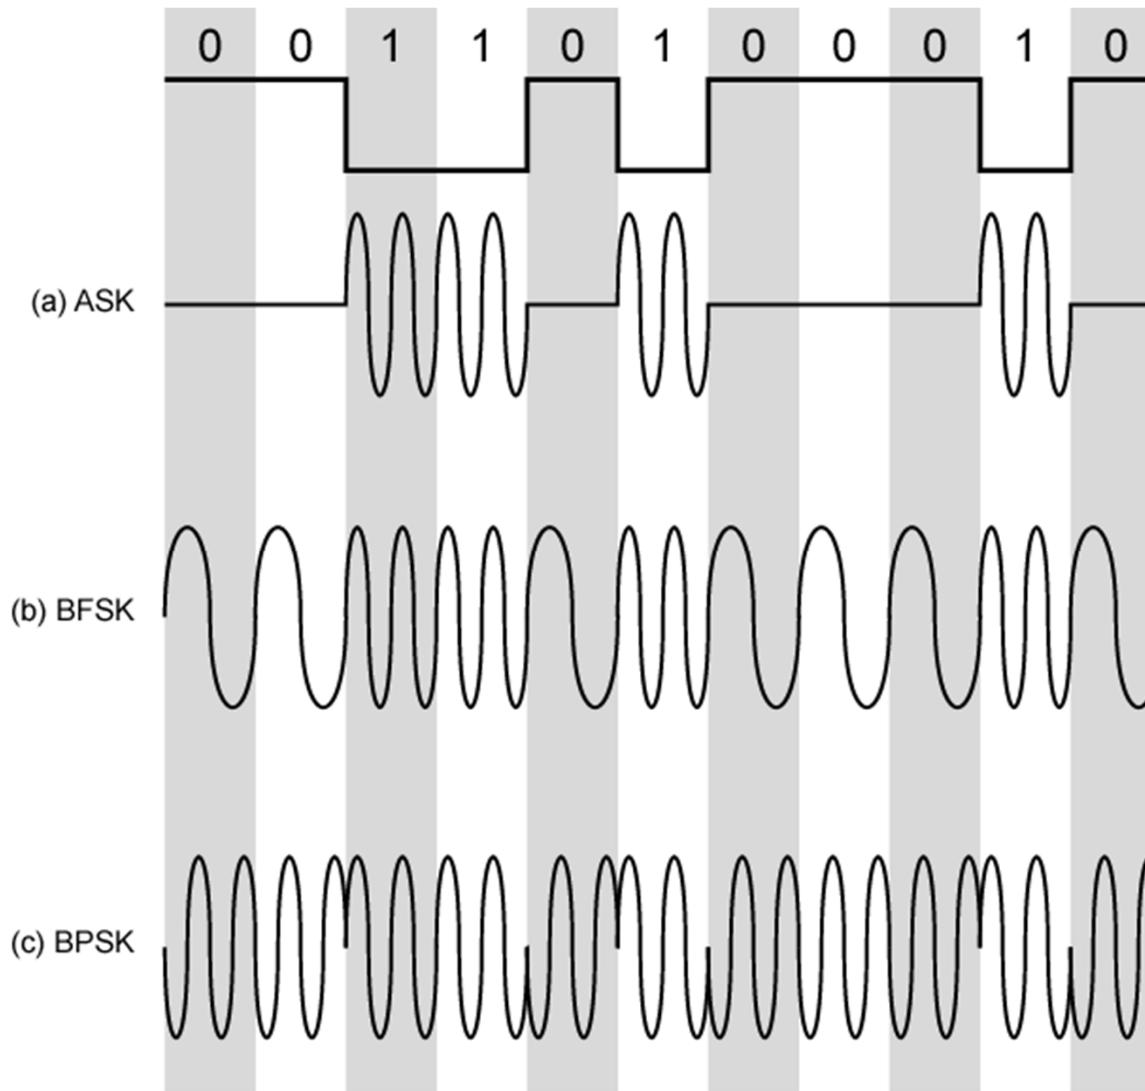

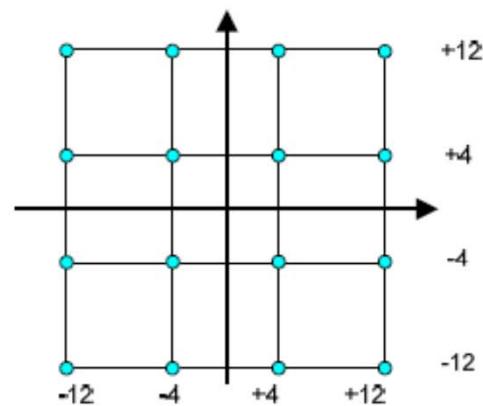

Figure 5.7

Quadrature Amplitude Modulation

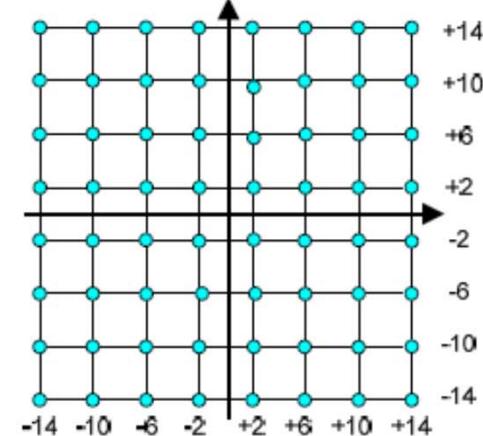

- QAM used on asymmetric digital subscriber line (ADSL) and some wireless
- combination of ASK and PSK
- send two different signals simultaneously on same carrier frequency
 - use two copies of carrier, one shifted 90°
 - each carrier is ASK modulated
 - two independent signals over same medium
 - demodulate and combine for original binary output

QAM examples

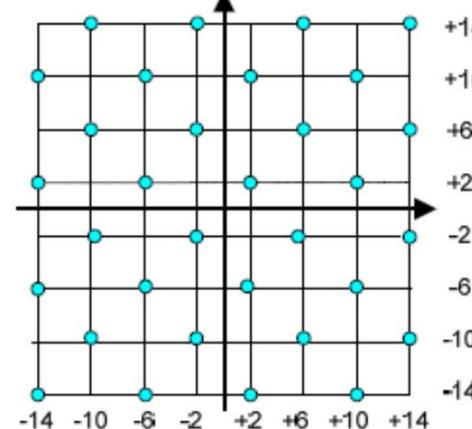

16 QAM-SQ: $E_{av} = 160$ ($G_{const} = -0.21$ dB)

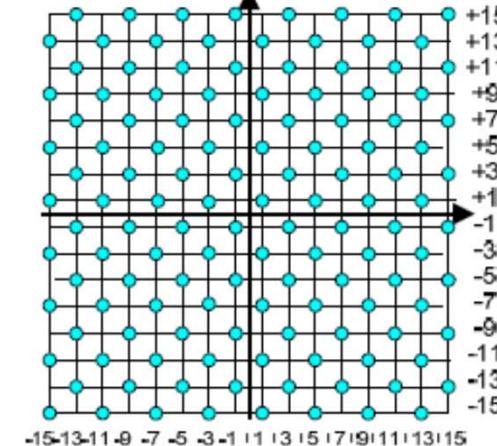

64 QAM-SQ: $E_{av} = 168$ ($G_{const} = 0$ dB)

32 QAM-DS: $E_{av} = 168$ ($G_{const} = 0$ dB)

128 QAM-DS: $E_{av} = 170$ ($G_{const} = +0.05$ dB)

https://www.youtube.com/watch?v=qs2QcycqgWU&ab_channel=BranchEducation

45 Min 22:12 to the end

Pulse Code Modulation (PCM)

- sampling theorem:
 - “If a signal is sampled at regular intervals at a rate higher than twice the highest signal frequency, the samples contain all information in original signal”
 - eg. 4000Hz voice data, requires 8000 sample per sec
- strictly have analog samples
 - Pulse Amplitude Modulation (PAM)
- so assign each a digital value

PCM Example

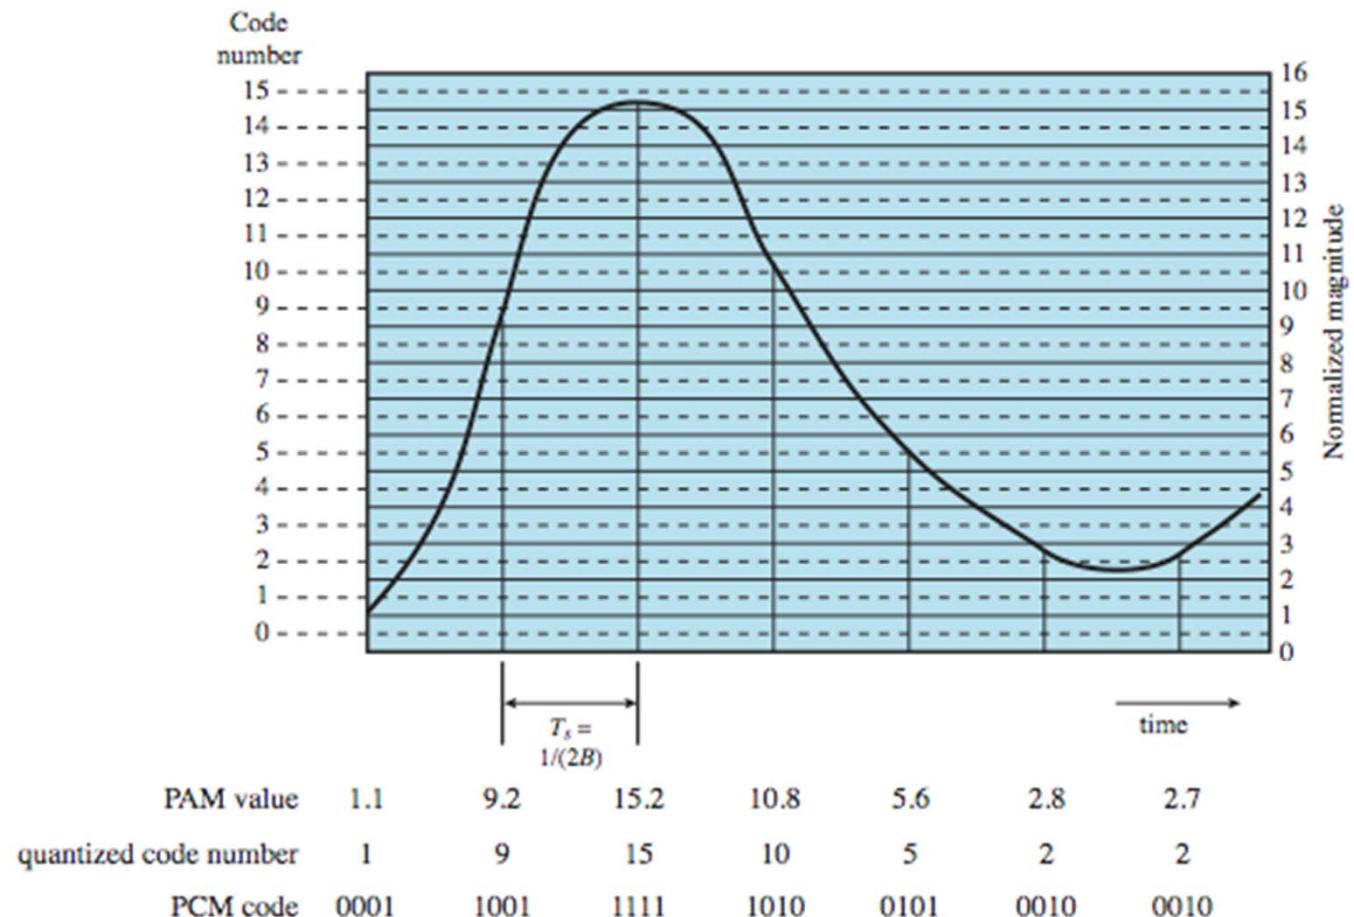

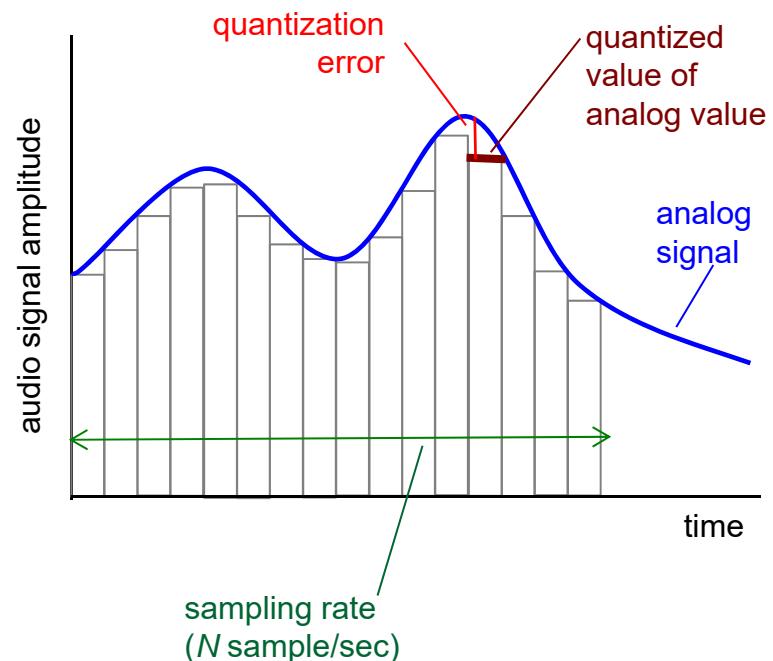

Figure 5.17

Multimedia: audio

- analog audio signal sampled at constant rate
 - telephone: 8,000 samples/sec
 - CD music: 44,100 samples/sec
- each sample quantized, i.e., rounded
 - e.g., $2^8=256$ possible quantized values
 - each quantized value represented by bits, e.g., 8 bits for 256 values

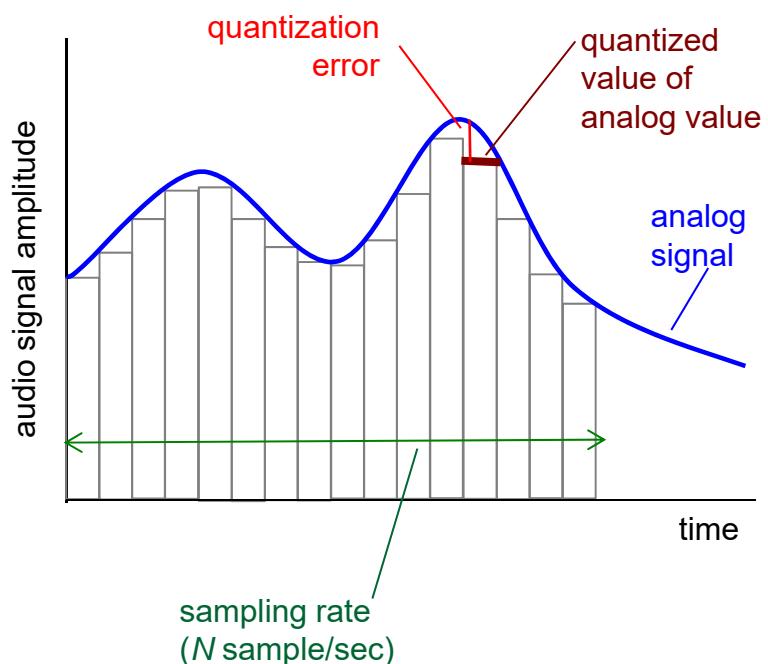

Multimedia: audio

- example: 8,000 samples/sec, 256 quantized values: 64,000 bps
- receiver converts bits back to analog signal:
 - some quality reduction

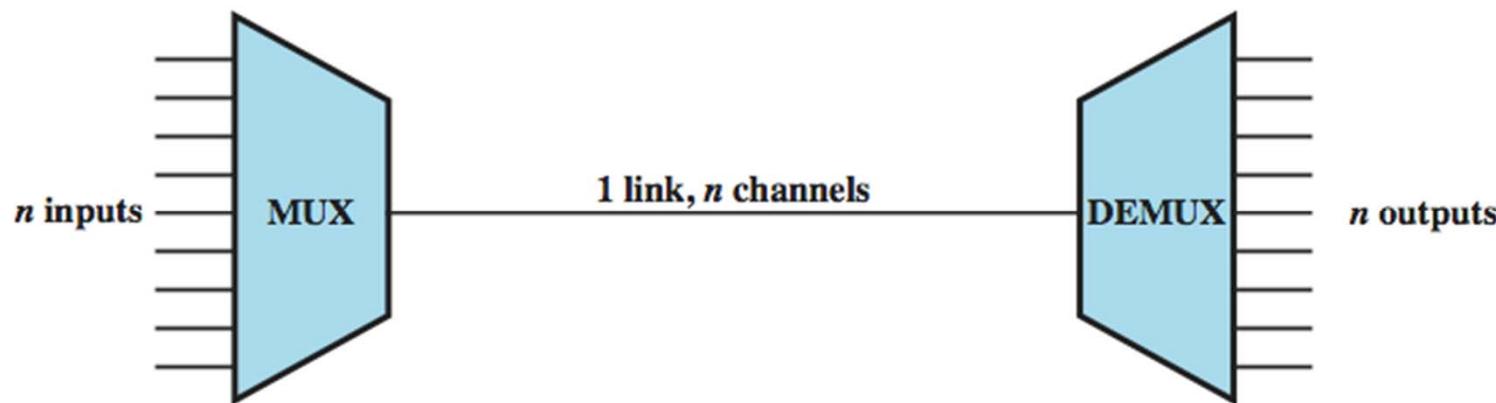

example rates

- CD: 1.411 Mbps
- MP3: 96, 128, 160 kbps
- Internet telephony: 5.3 kbps and up

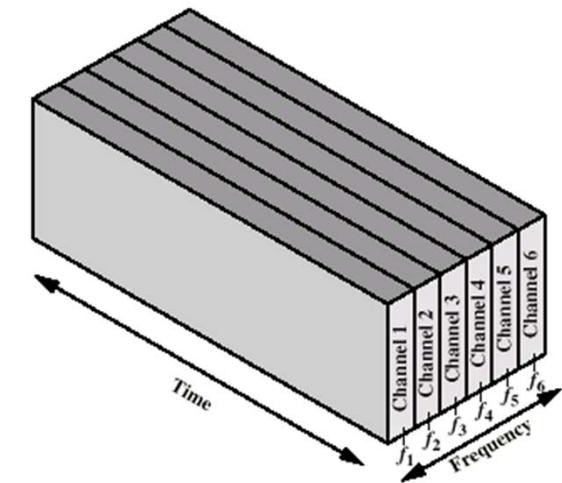

3. Multiplexing

- multiple links on 1 physical line
- common on long-haul, high capacity, links
- have FDM, TDM, STDM alternatives

Frequency Division Multiplexing

- FDM
- Useful bandwidth of medium exceeds required bandwidth of channel
- Each signal is modulated to a different carrier frequency
- Carrier frequencies separated so signals do not overlap (guard bands)
- e.g. broadcast radio
- Channel allocated even if no data

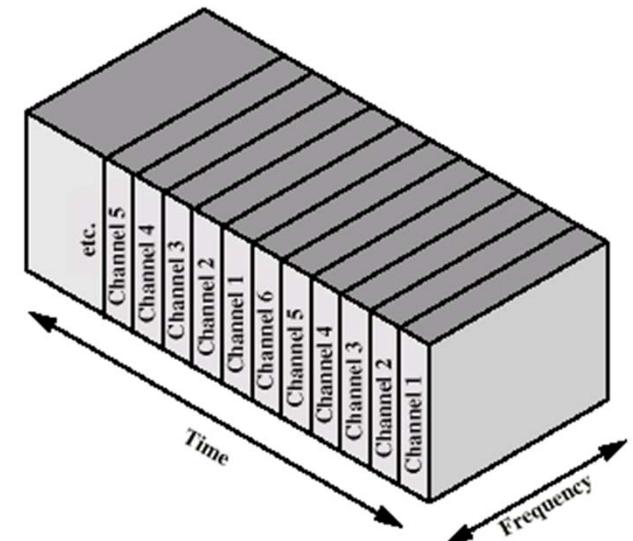

Wavelength Division Multiplexing

- Multiple beams of light at different frequency
- Carried by optical fiber
- A form of FDM
- Each color of light (wavelength) carries separate data channel
- Commercial systems of 400 Gbps now available

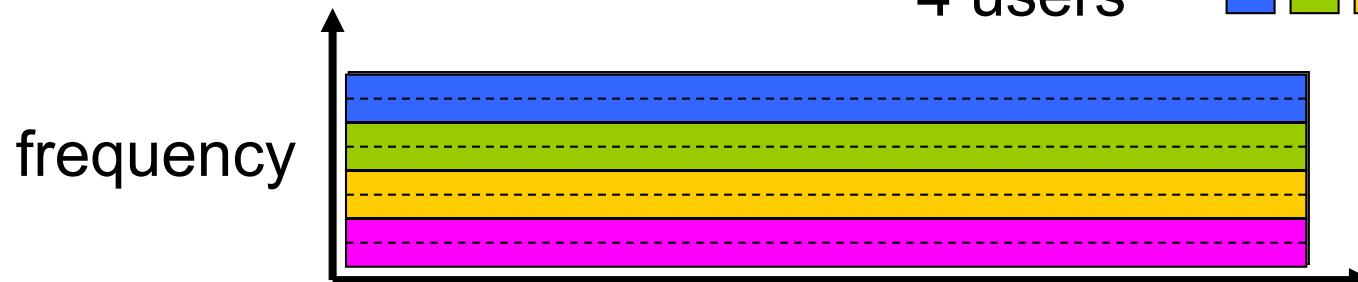

Time Division Multiplexing

- Data rate of medium exceeds data rate of digital signal to be transmitted
- Multiple digital signals interleaved in time
- May be at bit level or blocks
- Time slots preassigned to sources and fixed
- Time slots allocated even if no data
- Time slots do not have to be evenly distributed amongst sources

FDM versus TDM

FDM

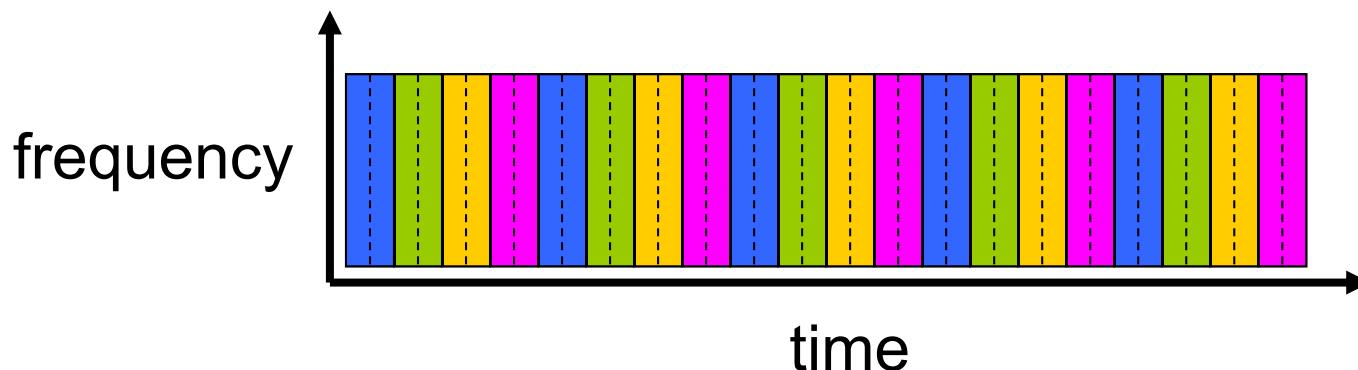

Example:

4 users

TDM

Multiplexació digital **Xarxes SDH**

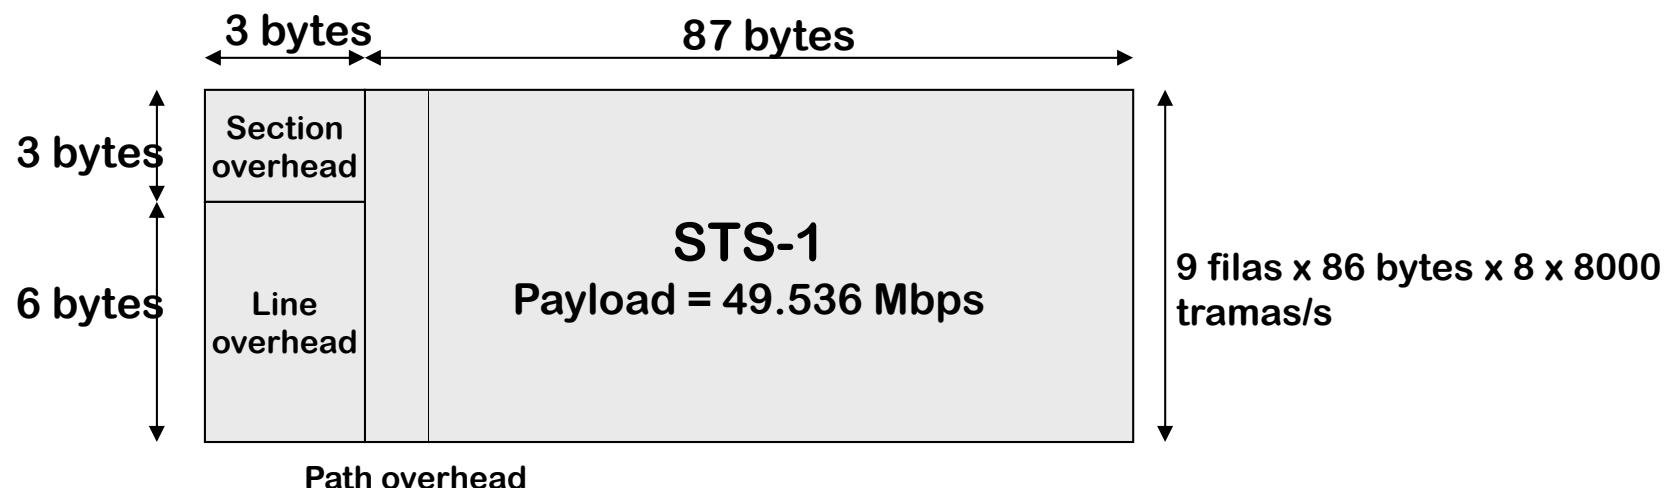

SONET/SDH

- Synchronous Optical Network (ANSI)
- Synchronous Digital Hierarchy (ITU-T)
- High speed capability of optical fiber
- Defines hierarchy of signal rates
 - *Synchronous Transport Signal level 1 (STS-1) or Optical Carrier level 1 (OC-1) is 51.84Mbps*
 - *Carries one DS-3 or multiple (DS1 DS1C DS2) plus ITU-T rates (e.g., 2.048Mbps)*
 - *Multiple STS-1 combine into STS-N signal*
 - *ITU-T lowest rate is 155.52Mbps (STM-1)*

SONET

- SONET transmite datos en tramas:

- La trama OC-1 es un conjunto bidimensional de 90 columnas por 9 filas de octetos (bytes).
 - Las primeras 3 columnas (27 bytes) son el *overhead de transporte*
 - La velocidad es 8000 tramas por segundo (cada 125 microsegundos):
 - $90 \times 9 \times 8 \times 8000 = 90 \times 9 \times 64 \text{ kbps} = 51.84 \text{ Mbps}$
- La trama de OC-n son n tramas de OC-1

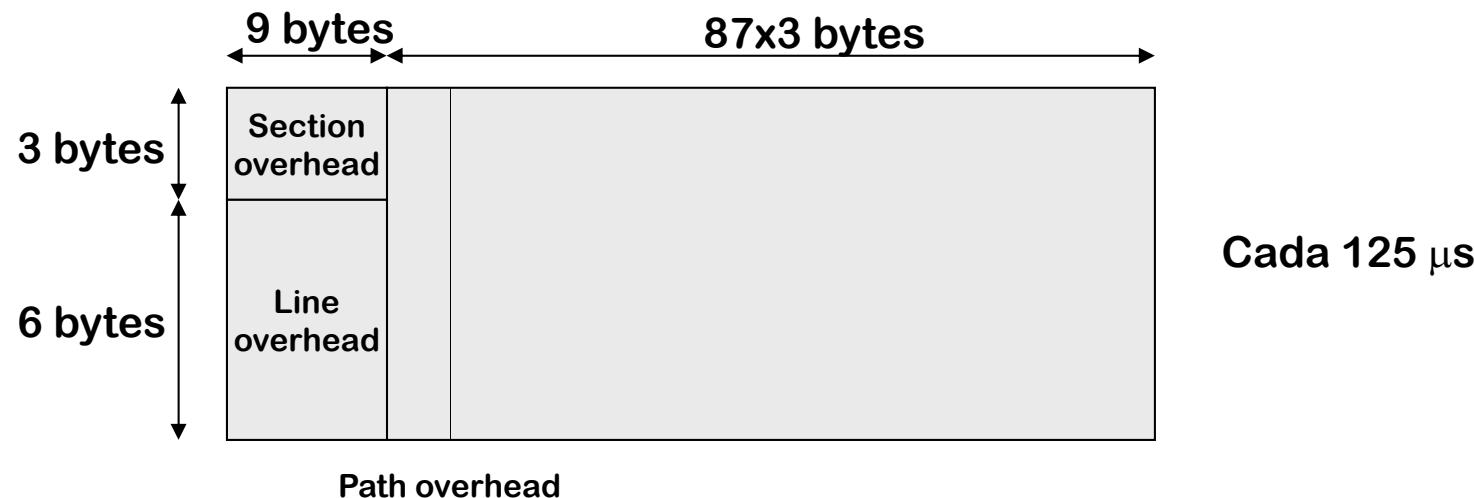

SDH

- SDH: Synchronous Digital Hierarchy
- SDH es una tecnología de transmisión (G.707-G.709)
 - la forma en que los datos están codificados
 - velocidades
 - esquemas de multiplexación
 - técnicas de codificación
 - medios de transmisión

SDH

- 3 tramas Sonet forman una SDH
- $3 \times 51.84 \text{ Mbps} = 155.52 \text{ Mbps}$

SONET/SDH Signal Hierarchy

SONET Designation	ITU-T Designation	Data Rate	Payload Rate (Mbps)
STS-1/OC-1		51.84 Mbps	50.112 Mbps
STS-3/OC-3	STM-1	155.52 Mbps	150.336 Mbps
STS-12/OC-12	STM-4	622.08 Mbps	601.344 Mbps
STS-48/OC-48	STM-16	2.48832 Gbps	2.405376 Gbps
STS-192/OC-192	STM-64	9.95328 Gbps	9.621504 Gbps
STS-768	STM-256	39.81312 Gbps	38.486016 Gbps
STS-3072		159.25248 Gbps	153.944064 Gbps

Multiplexació òptica

Xarxes OTN

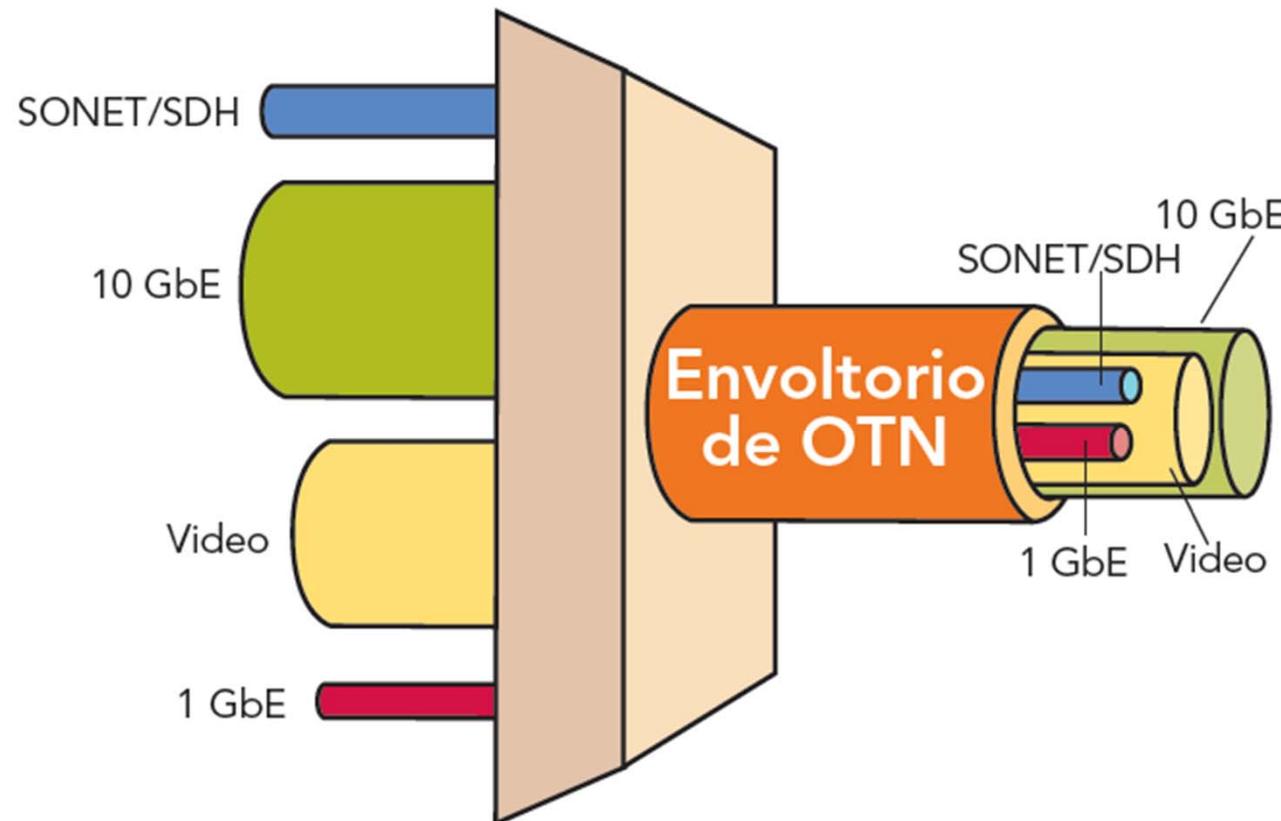

Mòdul de transport òptic (OTM)

Estructura de la linea OTN

Ports de clients

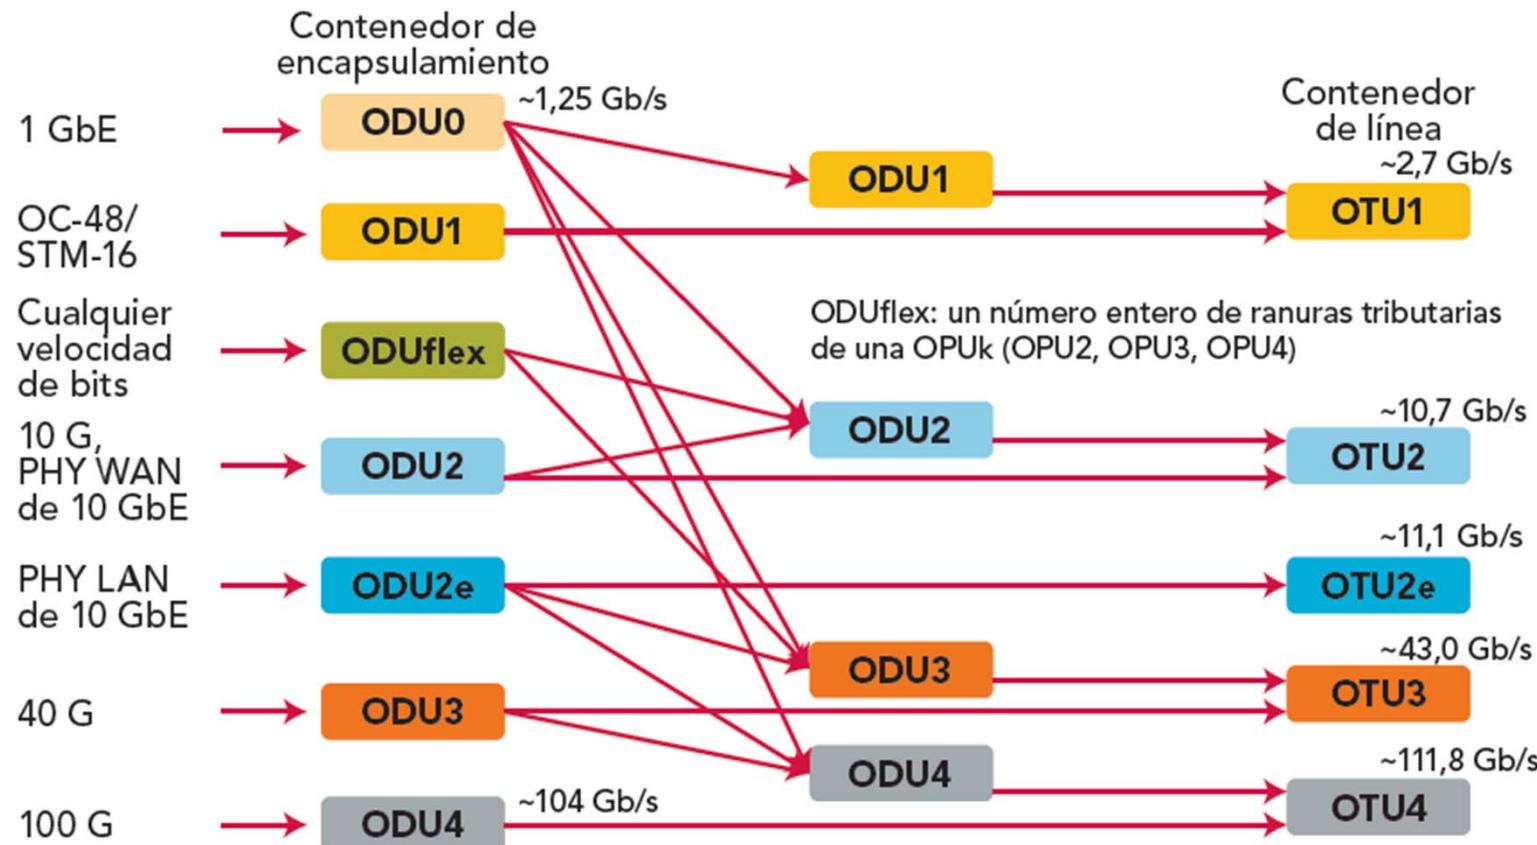

Velocitats de linea OTN

Señal	Velocidad aproximada de transmisión de datos (Gb/s)	Optimizada para
OTU1	2.66	Transporte de señal SONET OC-48 o SDH STM-16
OTU2	10.70	Transporte de capa física (PHY) de red de área amplia (WAN) de 10 GbE o SONET OC-192 O SDH STM-64
OTU2e	11.09	Transporte PHY de red de área local (LAN) de 10 GbE (para puertos de enrutadores /comutadores de IP/ Ethernet) a velocidad de línea máxima (10,3 Gb/s)
OTU3	43.01	Transporte de señal de 40 GbE o SONET OC-768, SDH STM-256
OTU3e2	44.58	Transporte de hasta cuatro señales OTU2e
ODU4	112	Transporte de señal de 100 GbE

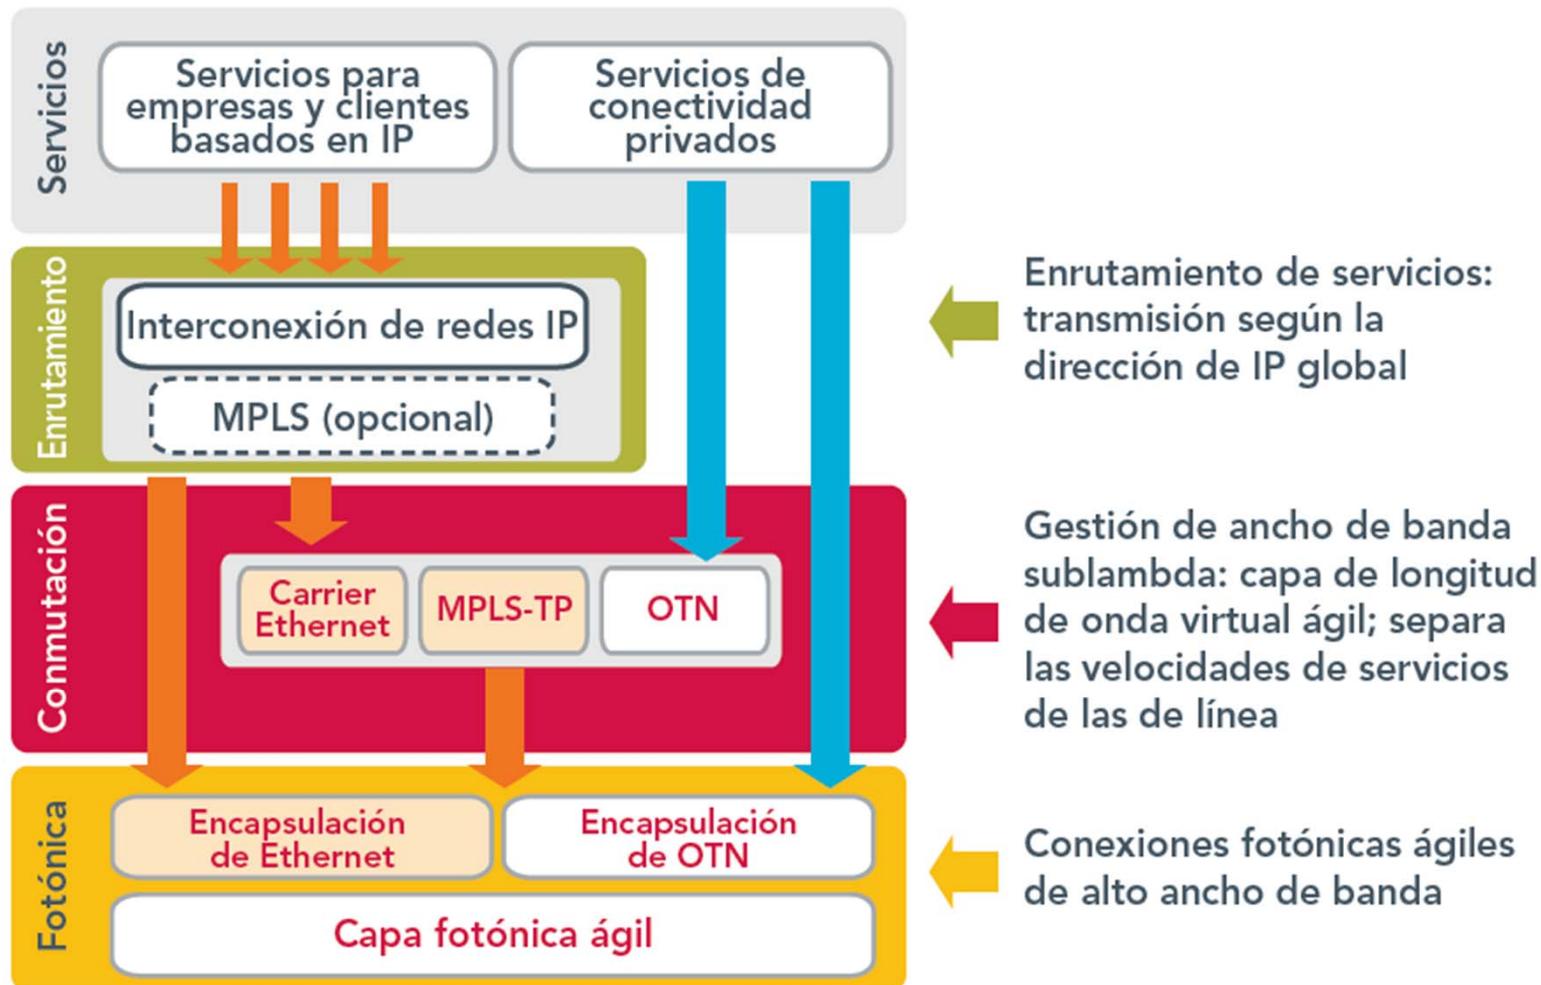

Velocitats de ODUk

Señal	Velocidad de datos (Gb/s)	Optimizada para
ODU0	1.24416	Transporte de una señal 1000BASE-X transcodificada (comprimida) y transparente de temporización o paquetes sobre GFP
ODU1	2.49877512605042	Transporte de dos señales ODU0, una señal STS-48/STM-16 o paquetes sobre GFP
ODU2	10.0372739240506	Transporte de hasta ocho señales ODU0, hasta cuatro señales ODU1, una señal STS-192/STM-64, una PHY WAN o paquetes sobre GFP
ODU2e	10.3995253164557	Transporte de una señal de 10GbE o una señal de canal de fibra de 10 G transcodificada (comprimida) y transparente de temporización
ODU3	40.3192189830509	Transporte de hasta 32 señales ODU0, hasta 16 señales ODU1, hasta cuatro señales ODU2, una señal STS-768/STM-256, una señal de 40 GbE transcodificada y transparente de temporización o paquetes sobre GFP
ODU3e2	41.7859685595012	Transporte de hasta cuatro señales ODU2e
ODU4	104.794445814978	Transporte de hasta 80 señales ODU0, hasta 40 señales ODU1, hasta diez señales ODU2, hasta dos señales ODU3 o una señal de 100GbE
ODUflex (CBR)	$\frac{2^{39}}{2^{28}}$ por velocidad de bits del cliente	Transporte de una señal de velocidad de bits constante, como el canal de fibra de 8 GFC, Infiniband o video
ODUflex (GFP)	Cualquier velocidad configurada	Transporte de paquetes por GFP

Jerarquia d'assignació OTN

Adecuació d'OTN

4. Switched Network

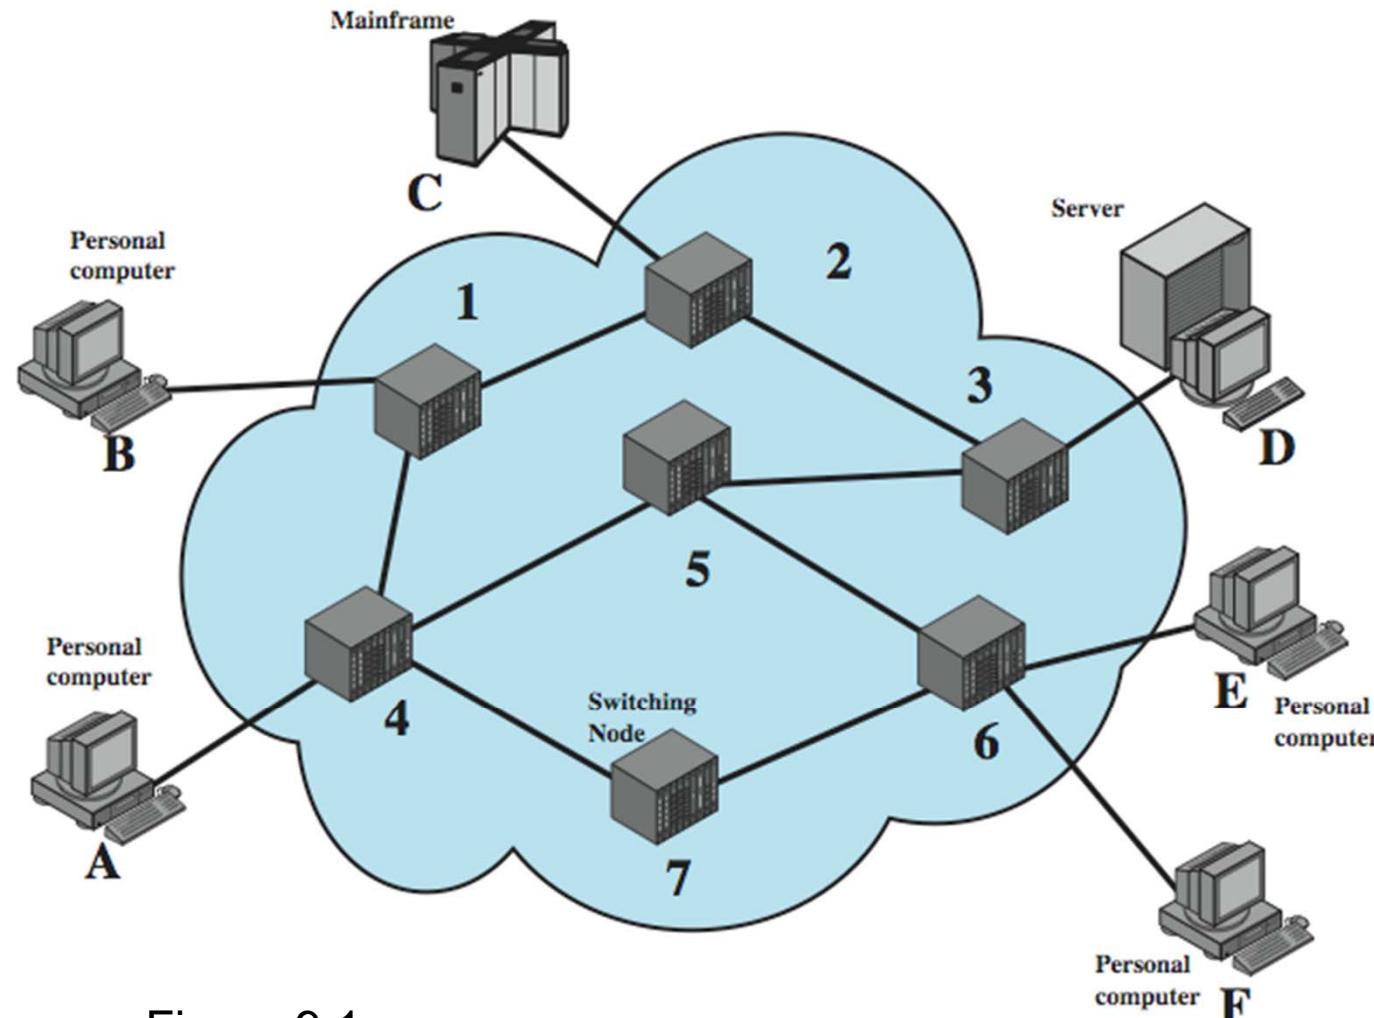

Figure 9.1

Nodes

- a collection of nodes and connections is a communications network
- nodes may connect to other nodes only, or to stations and other nodes
- network is usually partially connected
 - some redundant connections are desirable
- have two different switching technologies
 - circuit switching
 - packet switching

Circuit Switching

- uses a dedicated path between two stations
- has three phases
 - establish
 - transfer
 - disconnect
- inefficient
 - channel capacity dedicated for duration of connection
 - if no data, capacity wasted
- set up (connection) takes time
- once connected, transfer is transparent

Packet Switching

- circuit switching was designed for voice
- packet switching was designed for data
- transmitted in small packets
- packets contains user data and control info
 - user data may be part of a larger message
 - control info includes routing (addressing) info
- packets are received, stored briefly (buffered) and pass on to the next node

Packet Switching

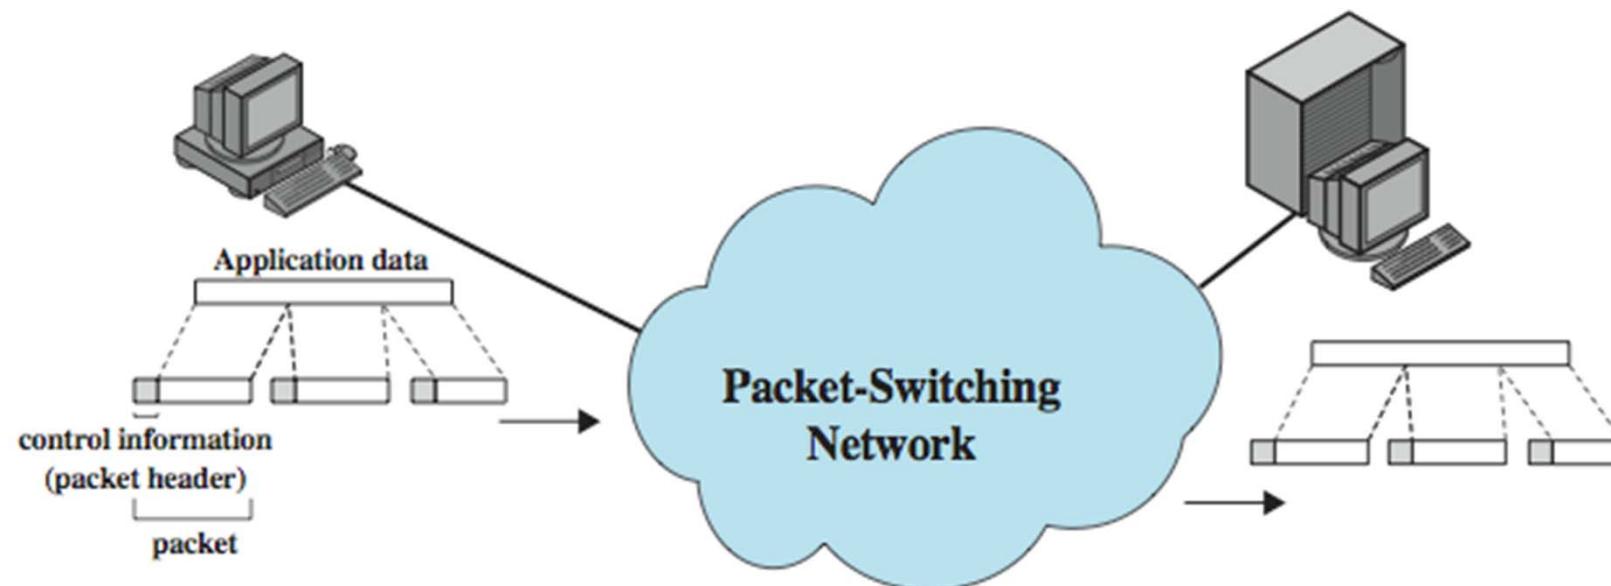

Figure 9.10

Advantages

- line efficiency
 - single link shared by many packets over time
 - packets queued and transmitted as fast as possible
- data rate conversion
 - stations connects to local node at own speed
 - nodes buffer data if required to equalize rates
- packets accepted even when network is busy
- priorities can be used

Datagram Diagram

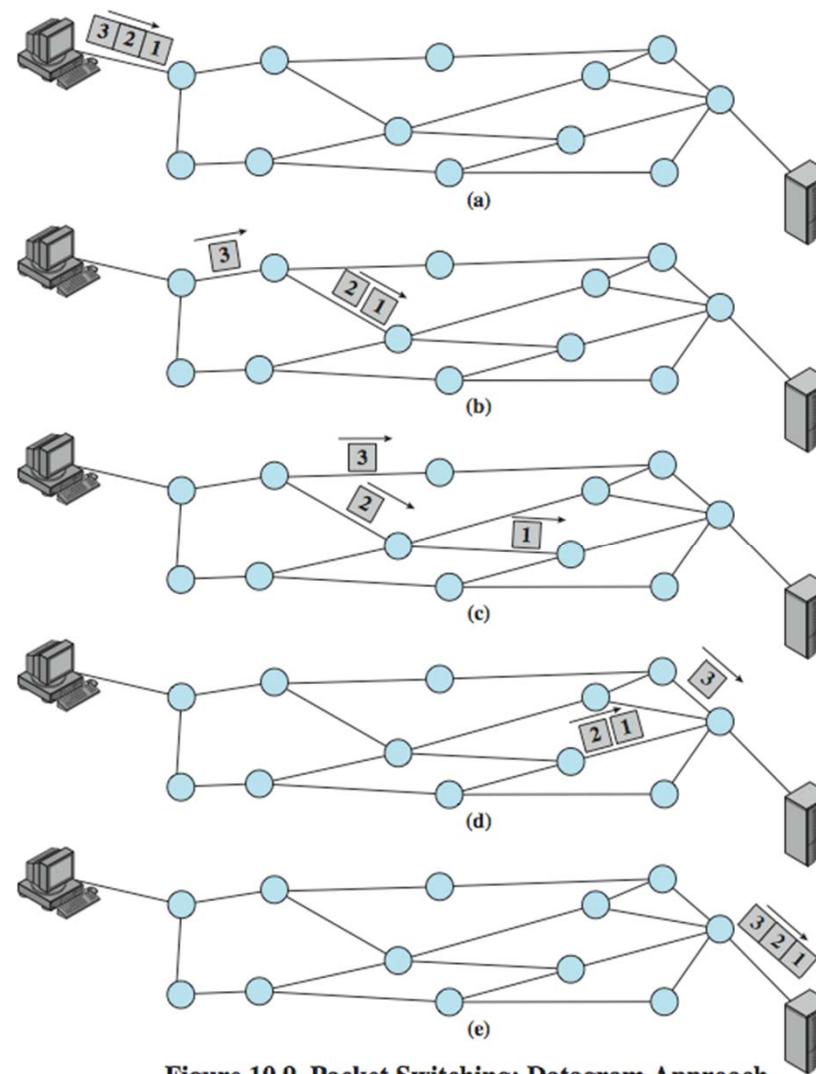

Figure 9.11

Figure 10.9 Packet Switching: Datagram Approach

Virtual Circuit Diagram

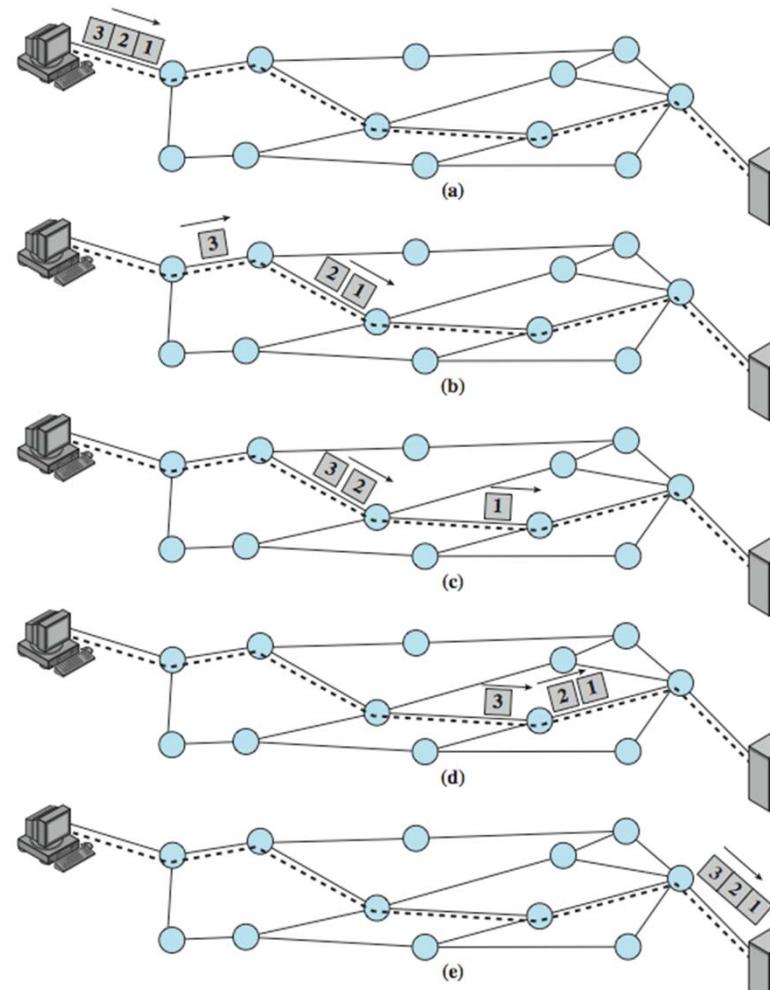

Figure 9.12

Figure 10.10 Packet Switching: Virtual-Circuit Approach

Virtual Circuits v Datagram

- virtual circuits
 - network can provide sequencing and error control
 - packets are forwarded more quickly
 - less reliable
- datagram
 - no call setup phase
 - more flexible
 - more reliable

Packet Size

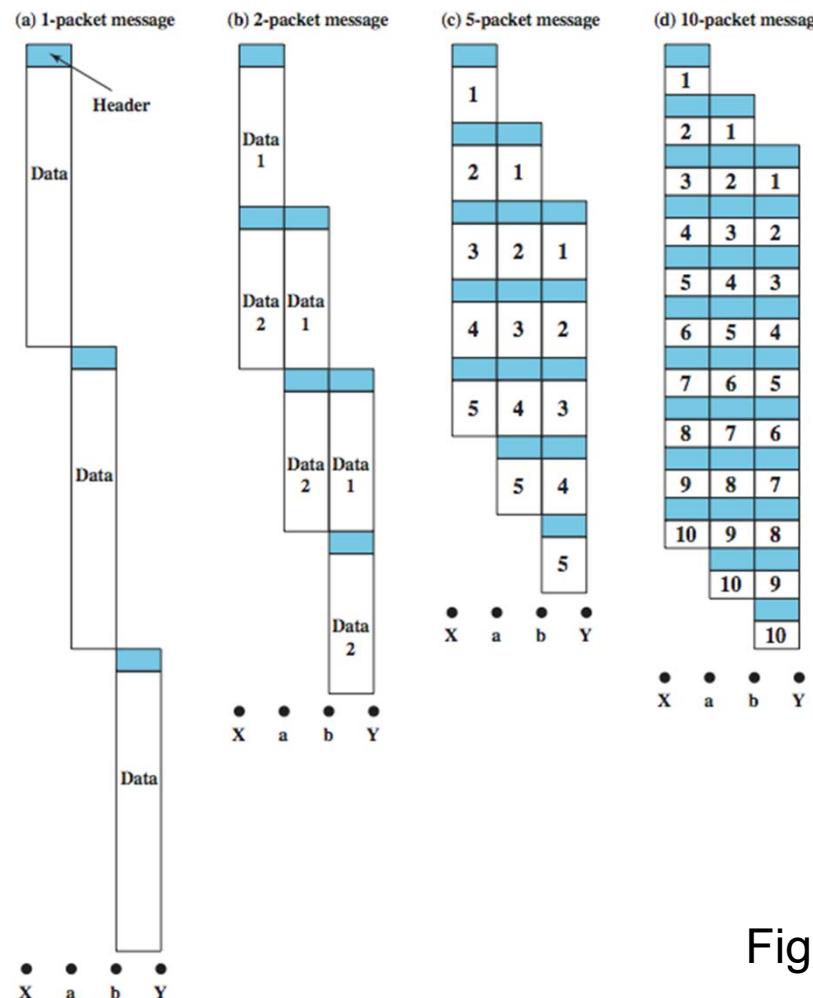

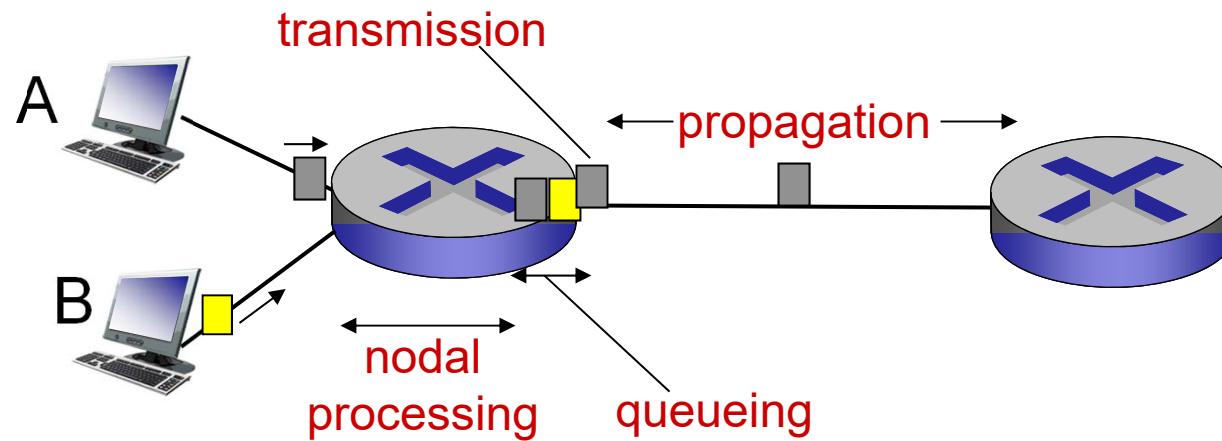

Figure 9.13

2.3 Fonts del retard de paquets

Four sources of packet delay

$$d_{\text{nodal}} = d_{\text{proc}} + d_{\text{queue}} + d_{\text{trans}} + d_{\text{prop}}$$

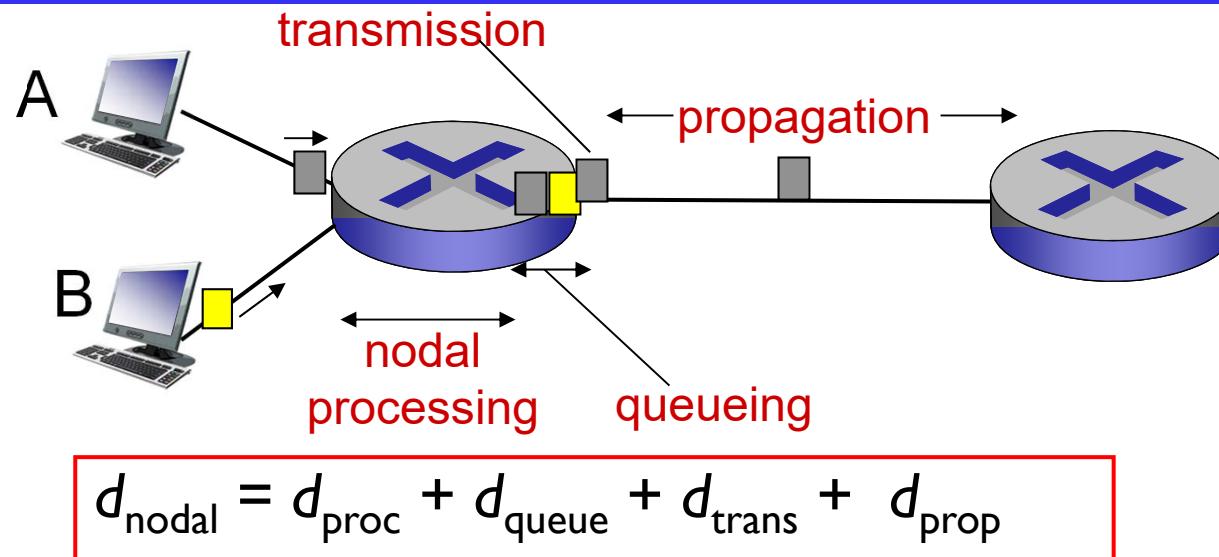

d_{proc} : nodal processing

- check bit errors
- determine output link
- typically < msec

d_{queue} : queueing delay

- time waiting at output link for transmission
- depends on congestion level of router

Four sources of packet delay

d_{trans} : transmission delay:

- L : packet length (bits)
- R : link bandwidth (bps)
- $d_{\text{trans}} = L/R$

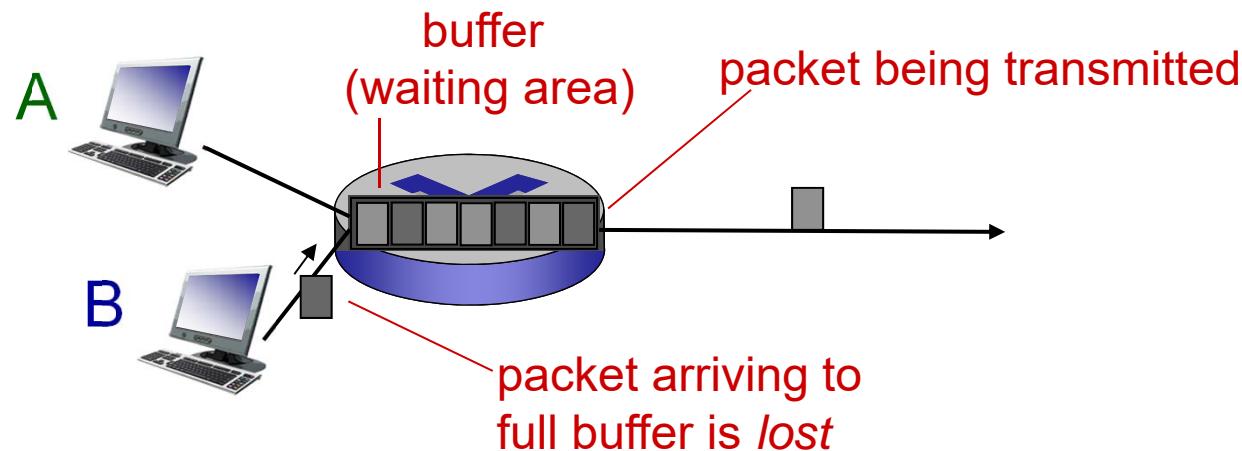

d_{trans} and d_{prop}
very different

d_{prop} : propagation delay:

- d : length of physical link
- s : propagation speed ($\sim 3 \times 10^8$ m/sec)
- $d_{\text{prop}} = d/s$

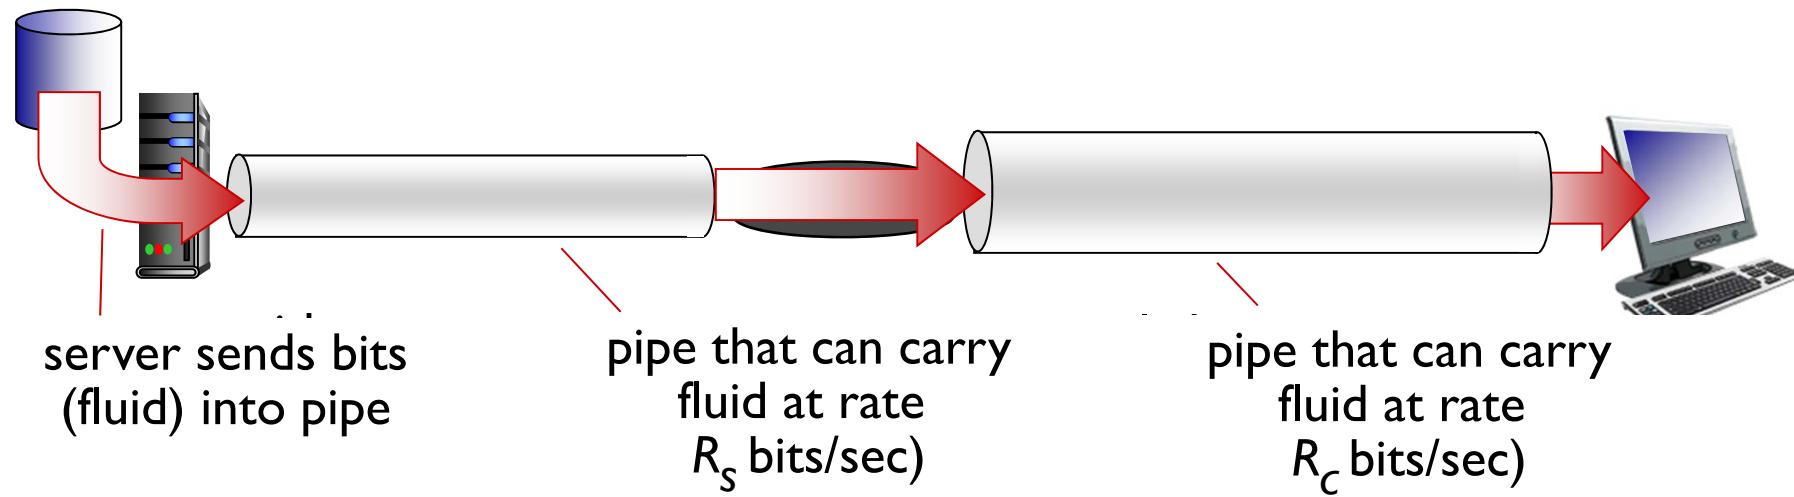

Packet loss

- queue preceding link in buffer has finite capacity
- packet arriving to full queue dropped
- lost packet may be retransmitted by previous node, by source end system, or not at all

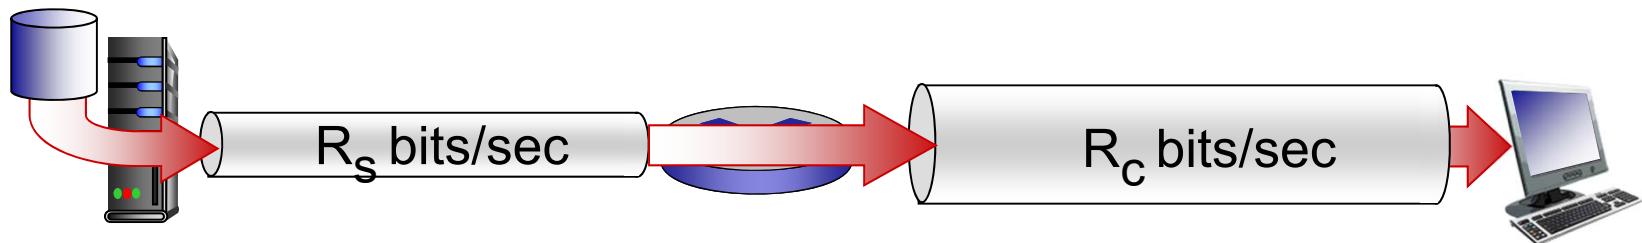

Throughput

- **throughput:** rate (bits/time unit) at which bits transferred between sender/receiver
 - *instantaneous:* rate at given point in time
 - *average:* rate over longer period of time

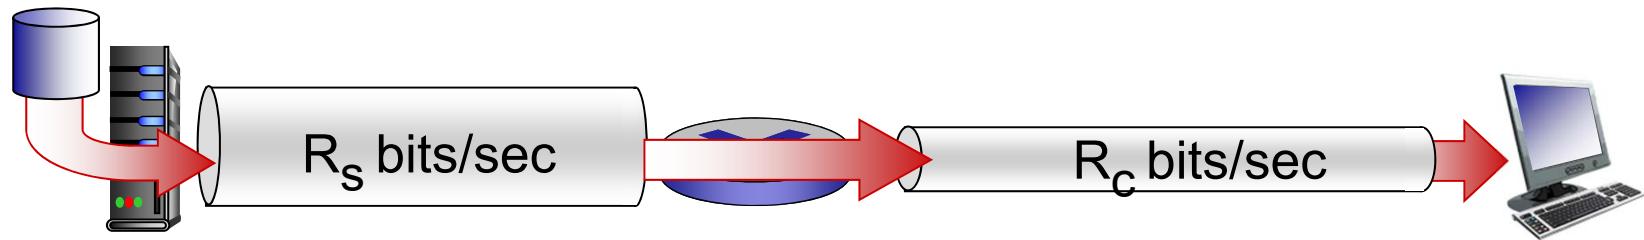

Throughput (more)

- $R_s < R_c$ What is average end-end throughput?

- $R_s > R_c$ What is average end-end throughput?

bottleneck link

link on end-end path that constrains end-end throughput
